The positive hydrogen clusters $H^+(H_2)$/sub n/ for n = 1, 2, 3, 4 have been studied via nonempirical molecular electronic structure theory. Using double zeta (DZ) and double zeta plus polarization (DZ+P) basis sets, wave functions are reported at both the self-consistent field (SCF) and configuration interaction including all single and double excitations (CISD) levels of theory. In each case analytic gradient techniques have been used to locate stationary point geometries and to predict harmonic vibrational frequencies. The effects of electron correlation are shown to be greater for these loose molecular complexes than for ordinary molecules. Although $H^+_5$ in its lowest energy conformation is not qualitatively described as $H^+_3xH_2$, the larger molecular ions do fit the qualitative picture $H^+_3(H_2)$/sub n/, with $H^+_3$ as a nucleating center. Of special interest here are the "new" normal modes of these clusters, i.e., those modes having no counterpart in the isolated $H^+_3$ or $H_2$ species. There are 15 such vibrational degrees of freedom for $H^+_9$, and the resulting harmonic vibrational frequencies range from 775 $cm^{-1}$ all the way down to 63 $cm^{-1}$. Dissociation energies as a function of cluster size follow the pattern established experimentally by Hiraoka and Kebarle.

3587 **Distribution of internal energy in CO and $CO_2$ vibrationally excited by a hot platinum surface.** Mantell, D.A.; Ryali, S.B.; Haller, G.L.; Fenn, J.B. (Department of Chemical Engineering, Yale University, New Haven, Connecticut 06520). *Journal of Chemical Physics;* **78**: No. 6, 4250-4255(15 Mar 1983).

Changes in the internal state of CO and $CO_2$ molecules scattered by a hot platinum surface have been characterized by Fourier transform infrared emission spectroscopy. The only molecules which can be detected are those that are vibrationally excited for CO and excited to the asymmetric stretch mode for $CO_2$. The distribution of rotational energy in these molecules is Boltzmann for $CO_2$ but not for CO. In both cases, the rotational energy is substantially less than the equilibration values based on the surface temperature. The accommodation coefficient for the asymmetric stretch vibrational mode of $CO_2$ drops from 0.22 at 700 K to 0.16 at 1500 K. Very few of the molecules which are vibrationally excited in the asymmetric stretch mode are also excited in either the bending or symmetric stretch mode. For CO, the vibrational accommodation coefficient is about 0.7. However, the fraction of the molecules excited to the v = 2 vibrational level compared to the v = 1 level indicates complete vibrational accommodation at the surface temperature. This implies a partitioning of CO molecules between those that completely accommodate vibrationally and those that do not accommodate at all.

3588 **Supersonic copper clusters.** Powers, D.E.; Hansen, S.G.; Geusic, M.E.; Michalopoulos, D.L.; Smalley, R.E. (Rice Quantum Institute and Department of Chemistry, Rice University, Houston, Texas 77251). *Journal of Chemical Physics;* **78**: No. 6, 2866-2881(15 Mar 1983).

Copper clusters ranging in size from 1 to 29 atoms have been prepared in a supersonic beam by laser vaporization of a rotating copper target rod within the throat of a pulsed supersonic nozzle using helium for the carrier gas. The clusters were cooled extensively in the supersonic expansion [T(translational) 1 to 4 K, T(rotational) = 4 K, T(vibrational) = 20 to 70 K]. These clusters were detected in the supersonic beam by laser photoionization with time-of-flight mass analysis. Using a number of fixed frequency outputs of an exciplex laser, the threshold behavior of the photoionization cross section was monitored as a function of cluster size.nce two-photon ionization (R2PI) with mass selective detection allowed the detection of five new electronic band systems in the region between 2690 and 3200 A, for each of the three naturally occurring isotopic forms of $Cu_2$. In the process of scanning the R2PI spectrum of these new electronic states, the ionization potential of the copper dimer was determined to be 7.894 +- 0.015 eV.

3589 **Theory of surface enhanced Raman scattering.** Arunkumar, K.A.; Bradley, E.B. (Department of Electrical Engineering, University of Kentucky, Lexington, Kentucky 40506). *Journal of Chemical Physics;* **78**: No. 6, 2882-2888(15 Mar 1983).

It is now generally accepted that more than one mechanism could be at work in enhancing the Raman signal from molecules adsorbed onto a rough surface. In this paper we present a simple surface coverage, surface roughness dependent model that accounts for one such mechanism. According to our model, each adsorbate is subjected to both polarizing and depolarizing fields from its oscillating neighbors. Competition between these two fields is shown to determine the magnitude of signal enhancement.

3590 **Photochemical formation and dissociation of molybdenum—dinitrogen complexes in krypton matrices.** Foosnaes, T.; Pellin, M.J.; Gruen, D.M. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439). *Journal of Chemical Physics;* **78**: No. 6, 2889-2898(15 Mar 1983).

Three molybdenum—dinitrogen complexes [$MoN_2$,Mo/sub x/($N_2$) and $Mo(N_2)_3$] have been synthesized in Kr matrices and characterized by means of the effects of isotopic substitution on the dinitrogen stretching frequencies. The Mo—N force constants calculated from these spectra are found to be 17.21 +- 0.02 mdyn/A for $MoN_2$ and f/sub r/ = 18.72 mdyn/A and f/sub r/r = 0.36 mdyn/A for $Mo(N_2)_3$. The Mo complexes appear to be unique in that rapid formation during co-deposition with $N_2$ occurs only upon photoexcitation of the Mo $^7S$—$^7P$ atomic resonance transition situated at 355 nm in Kr matrices. Although minor amounts of the dinitrogen complexes are formed during deposition in the absence of radiation, their concentration is not increased by thermal annealing. Each of the complexes gives rise to its own electronic absorption spectrum. Irradiation into the electronic absorption bands of individual complexes induced selective photodissociation. Photoinduced growth and decomposition studies allowed correlations to be made between the vibrational and corresponding electronic spectra.

3591 **Infrared absorption spectra of nitrogen oxides in liquid xenon. Isomerization of $N_2O_3$.** Holland, R.F.; Maier, W.B. II. (University of California, Los Alamos National Laboratory, Chemistry Division, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **78**: No. 6, 2928-2941(15 Mar 1983).

Infrared absorption spectra of nitrogen oxides present when NO and $NO_2$ are dissolved in liquid xenon between 160 and 220 K have been measured. Spectral absorptions of NO, $NO_2$, $(NO)_2$, $N_2O_4$, and $N_2O_3$ are identified, and integrated absorption cross sections are given for several spectral features. The spectra suggest that symmetric $N_2O_3$ and asymmetric $N_2O_3$ are in equilibrium in solution and that the energy difference between these two isomers is 1.8 +- 0.2 kcal/mol.

**3592 Spectral distribution of $CO_2$ vibrational states produced by collisions with fast hydrogen atoms from laser photolysis of HBr.** Chu, J.O.; Flynn, G.W.; Weston, R.E. Jr. (Department of Chemistry and Columbia Radiation Laboratory, Columbia University, New York, New York 10027). *Journal of Chemical Physics;* **78**: No. 6, 2990-2997(15 Mar 1983).

193 nm photofragmentation of HBr molecules in $HBr/CO_2$ mixtures produces energetic (~2.5 eV) hydrogen atoms which vibrationally excite $CO_2$ molecules via an inelastic translation-vibration/rotation (T-V/R) energy exchange process. Prompt infrared emission in the 4.3 μm region has been wavelength resolved, and the spectral energy distribution associated with the excited $CO_2$ product was measured. The emission profile is strongly red shifted from the spectral region of the $\nu_3$ ($00^01$—$00^00$) fundamental transition indicating that these energetic collisions preferentially produce combination and overtone levels with oscillator strength in the 4.3 μm region. Cold gas filter studies show that significant emission originates from $CO_2$ bend—stretch excitation compared to pure stretching excitation. Approximately 15% of the emission is due to the $01^11$—$01^10$ transition while the remaining fluorescence has contributions from levels above the $01^11$ state. The data are in qualitative agreement with theoretical calculations on $O/CO_2$ collisions employing either quasiclassical trajectory or infinite order sudden methods, but do not agree with predictions based upon either (harmonic oscillator) breathing sphere theory or statistical theory.

**3593 Validity of the energy sudden approximation.** Chang, B.; Eno, L.; Rabitz, H. (Department of Chemistry, Princeton University, Princeton, New Jersey 08544). *Journal of Chemical Physics;* **78**: No. 6, 3027-3031(15 Mar 1983).

This paper contains an examination of the conditions under which the energy sudden (ES) approximation may be expected to be valid. Our approach involves using dimensional analysis to identify (dimensionless) quantities which control energy suddenness and in this fashion three sets of ES criteria emerge. One involves the relative kinetic energy between collision partners and the energy spacing of the internal states of interest; another the strength of the coupling interaction and the same spacing; and a third involves the masses of the colliding molecules and component atoms. We discuss the relationship between these conditions and the justifications given by earlier workers for adopting the ES approximation and then the mass conditions in particular are used as the basis for certain broad statements concerning the applicability of the ES method within nonreactive diatom—diatom and reactive atom—diatom collisions. Finally, a number of avenues for further development of this work are discussed.

**3594 Tests of the quasiclassical trajectory cross-correlation moment method against accurate quantum dynamics for V—V energy transfer in HF—HF collisions.** Schwenke, D.W.; Thirumalai, D.; Truhlar, D.G.; Coltrin, M.E. (Department of Chemistry and Chemical Physics Program, University of Minnesota, Minneapolis, Minnesota 55455). *Journal of Chemical Physics;* **78**: No. 6, 3078-3083(15 Mar 1983).

. V—V energy transfer probabilities for breathing—sphere HF—HF collisions are calculated both by a quasiclassical trajectory moment analysis and by converged quantal close coupling calculations. The two methods agree within factors of 1.1—1.5 for transition probabilities greater than or equal to 0.17 and within factors of 1.9—9.5 for transition probabilities in the range 0.04—0.065, but only within factors of 5.1—82 for those in the range 0.0008—0.004 and within factors of 20—150 for those in the range 0.0002—0.0004.

**3595 Theoretical study of the properties of methyl radical.** Chipman, D.M. (Radiation Laboratory, University of Notre Dame, Notre Dame, Indiana 46556). *Journal of Chemical Physics;* **78**: No. 6, 3112-3132(15 Mar 1983).

A detailed ab initio study of the structure and properties of methyl radical in its ground electronic state is presented. The primary focus is on the spin density distribution and its dependence on basis set, wave function model, and molecular geometry. By using a natural orbital analysis that provides an unambiguous decomposition into core and valence contributions, interesting theoretical and computational results are found that clarify the relationships among CI, UHF, and PUHF models. In particular, it appears that the better agreement with experiment for the PUHF model as compared to UHF is simply fortuitous. A large and negative core contribution found in the $^{13}C$ isotropic hyperfine coupling constant explains why minimal basis set calculations always greatly overestimate this property, regardless of what wave function model is used. All the models studied give good results for anisotropic hfc and for the vibrational corrections to isotropic hfc, although not for the isotropic hfc themselves. Through comparison to the ab initio results, some conditions are revealed where semiempirical methods such as INDO should fail. The dependence of potential energy and various charge density properties on molecular geometry is also studied.

**3596 Raman spectra, ab initio molecular orbital calculations, vibrational analysis, and thermodynamic functions for $NH_3$:$AlX_3$ (X = F, Cl, Br).** Papatheodorou, G.N.; Curtiss, L.A.; Maroni, V.A. (Argonne National Laboratory, Argonne, Illinois 60439). *Journal of Chemical Physics;* **78**: No. 6, 3303-3315(15 Mar 1983).

Raman spectra of gaseous $NH_3$:$AlCl_3$ and $NH_3$:$AlBr_3$ were recorded at 400 °C. The observed Raman frequencies in combination with reported infrared frequencies for $NH_3$:$AlCl_3$ and ab initio molecular orbital calculations on $NH_3$:$AlCl_3$ and $NH_3$:$AlF_3$ were used to derive force constants for all three $NH_3$:$AlX_3$ complexes (X = F, Cl, Br) based on an adjusted valence force field (AVFF) concept. The resulting force constant calculations produced complete sets of $A_1$ and E mode frequencies for each complex. Statistical mechanical analyses were then performed using the $A_1$ and E mode frequencies together with estimated values for the torsional mode of each complex and published enthalpy data. From these analyses, the relative thermodynamic stability of each complex was determined. At 700 and 1000 K, $NH_3$:$AlCl_3$ was found to be more stable than $NH_3$:$AlBr_3$. It was further predicted that the reaction of gaseous $NH_3$ with solid $AlF_3$ to form $NH_3$:$AlF_3$ is not favored in this temperature range, which provides an explanation for the lack of success in prior efforts to produce $NH_3$:$AlF_3$.

**3597 $3p^6\,3d^9$-$3p^5\,3d^{10}$ transitions in cobaltlike ions from $Ba^{29+}$ to $Yb^{43+}$.** Reader, J. (National Bureau of Standards, Washington, D.C. 20234). *Journal of the Optical Society of America;* **73**: No. 1, 63-65(Jan 1983).

The $3p^6\,3d^9$-$3p^5\,3d^{10}$ transitions in the cobaltlike ions $Ba^{29+}$, $La^{30+}$, $Nd^{33+}$, $Sm^{35+}$, $Gd^{37+}$, $Dy^{39+}$, $Er^{41+}$, and $Yb^{43+}$ were observed with a laser-produced plasma and a 2.2-m grazing-incidence spectrograph. Predicted wavelengths were obtained for the $3p^6\,3d^9\ ^2D/$sub 5/2/-2D/sub 3/2/ magnetic dipole transitions in $Mo^{15+}$, $Xe^{27+}$, and $W^{47+}$.

**3598 Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42.** Victor, G.A.; Taylor, W.R. (Harvard-Smithsonian Center for Astrophysics, 60 Garden Street, Cambridge, Massachusetts 02138). *Atomic Data and Nuclear Data Tables;* **28**: No. 1, 107-214(Jan 1983). Contract AC02-76ER02887.

Semiempirical model-potential methods are used to calculate energy levels, wavelengths, and oscillator strengths for the copper and zinc isoelectronic sequences out to Mo XIV and Mo XIII, respectively.

**3599 Isotope effect in electron-capture differential cross sections at intermediate energies.** Rille, E.; Olson, R.E.; Peacher, J.L.; Blankenship, D.M.; Kvale, T.J.; Redd, E.; Park, J.T. (Physics Department, University of Missouri-Rolla, Rolla, Missouri 65401). *Physical Review Letters;* **49**: No. 25, 1819-1821(20 Dec 1982).

The isotope dependence in the angular distribution of electron-capture cross sections for protons and deuterons with equal velocity (E = 40 keV/u) colliding with atomic hydrogen or deuterium targets is predicted theoretically and observed experimentally. A projectile-dependent effect is observed at small scattering angles. No target dependence was detected in the differential cross sections. A scaling relationship is determined which permits the prediction of differential cross sections for hydrogen-isotope projectiles.

3600 **Optogalvanic response to light: photon energy vs photon number; comments.** Keller, R.A.; Zalewski, E.F. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Applied Optics;* **21**: No. 22, 3992(15 Nov 1982).

This Letter is a rebuttal of Kopeika's criticsm of our paper. To summarize the important points: We claimed that the magnitude of the optogalvanic effect (OGE) in U, Na, Eu, and Zr was independent of the ionization potential of the atom and depended on only the number of photons absorbed. Both mechanisms, increased electron temperature and direct ionization, undoubtably proceed simultaneously and the relative importance of one or the other probably depend on the experimental conditions. Our experiment has not demonstrated an increase in the electron temperature, rather our data appear to contradict the direct ionization mechanism in a hollow cathode discharge. More experimental evidence is necessary to determine the relative importance of the two mechanisms and their dependence on experimental conditions. (AIP)

3601 **Direct absorption measurement of the spin-orbit splitting of the ground state in atomic fluorine.** Laguna, G.A.; Beattie, W.H. (Los Alamos National Lab., NM). *Chemical Physics Letters;* **88**: No. 4, 439-440(14 May 1982).

Three hyperfine components of the spin-orbit split ($^2$P/sub 3/2/ → $^2$P/sub 1/2/) ground state in atomic fluorine have been measured by diode laser absorption spectroscopy. The measurement improves the accuracy of the two lines previously reported (404.175 and 403.969 cm$^{-1}$), with the third line at 404.210 cm$^{-1}$. This confirms the spacing of the hyperfine components measured by EPR, and establishes diode laser absorption as a viable technique for determining F-atom concentrations. 1 figure.

3602 **Level crossing studies on ion-collisionally excited He atoms in electric and magnetic fields.** Perschmann, W.D. Berlin, Germany F.R.; Techniche Universitaet (1982). 216p. (In German). Available from the library of Technische Univ. Berlin (Germany, F.R.).

The studies on ion-collisionally excited He atoms with the ion collision apparatus constructed in the framework of this thesis extended to the measurement of the tensor polarizabilities of 1snd$^1$D-terms with n=3,4,5 and 1snd$^3$D-terms with n= 3,4,5,6,7, the fine structure intervals ($n^3D_1$-$n^3D_2$) and ($n^3D_2$-$n^3D_3$) with n=3,4,5,6,7, and to the determination of the excitation matrix of the 1s4d$^1$D-term after collisional excitation by He$^+$ ions in the collision energy range from 10 keV to 40 keV. The determination of the tensor polarizabilities of the 1snd$^1$D terms was performed by the measurement of the magnetic field positions and position shifts of the ΔMsub(L)=2 level crossings produced in parallel electric and magnetic field. Furthermore after 35 keV He$^3$ collisional excitation besides the fine structure internals ($n^3D_1$-$n^3D_2$) which are determined by the measurement of the magnetic field positions of the fine structure level crossings registrated at higher magnetic field strengths also the fine structure intervals ($n^3D_2$-$n^3D_3$) are measured since by the electric field Esub(z) a separation of previously superposed fine structure level crossing signals is caused.

## 6404 Fluid Physics

3603 **(ANL—83-87) Fully coupled calculation of fluid flows with limited use of computer storage.** Vanka, S.P. (Argonne National Lab., IL (USA)). Oct 1983. Contract W-31-109-ENG-38. 30p. NTIS, PC A03/MF A01. Order Number DE84002218.

The report describes and demonstrates the performance of a modification to an earlier solution algorithm for the calculation of multidimensional fluid flow, heat transfer, and combustion processes. The modification significantly reduces the computer storage required by the earlier algorithm without degrading the rate of convergence. The modification called as telescoping subdomain analysis (TSDA) splits the flow domain into overlapping subregions and solves them in a sequence, with known conditions on the boundaries of the subregions. The procedure has been tested in four different two-dimensional recirculating flows and the convergence rates have been equivalent to the rates with full-domain analysis. The modification offers significant savings of computer storage and cost and permits calculations with larger finite-difference grids.

3604 **Enskog theory for multicomponent mixtures. II. Mutual diffusion.** Kincaid, J.M.; Lopez de Haro, M.; Cohen, E.G.D. (Thermophysics Division, National Bureau of Standards, Washington, DC 20234). *Journal of Chemical Physics;* **79**: No. 9, 4509-4521(1 Nov 1983).

We present a detailed description of the mutual diffusion coefficients of binary and ternary dense fluid mixtures of hard spheres, as given by the revised Enskog theory (RET) of van Beijeren and Ernst and the standard Enskog theory (SET) of Tham and Gubbins. The formulas for the diffusion coefficients [see part I of this series, J. Chem. Phys. 78, 2746 (1983)] involve the contact values of the equilibrium pair distribution functions and the chemical potentials, for which the Carnahan—Starling approximation is used. The formulas, which were obtained by making an expansion in Sonine polynomials, are evaluated up to the third order and the convergence of the Sonine polynomial expansion is discussed. Except at low densities, the SET cannot be used to describe diffusion in hard-sphere mixtures. We find, using the CS approximation, that the SET gives values for the direct mutual diffusion coefficients that become negative at very high densities. A study is made of the dependence of the RET mutual diffusion coefficients on a variety of the parameters that determine the mixture (density, composition, molecular masses, and diameters) and a summary of the trends found is given. In particular, the influence of the addition of a third component on the mutual diffusion of two other components is discussed.

3605 **Liquid structure under shear: Comparison between computer simulations and colloidal suspensions.** Hanley, H.J.M.; Rainwater, J.C.; Clark, N.A.; Ackerson, B.J. (Chemical Engineering Science Division, National Engineering Laboratory, National Bureau of Standards, Boulder, Colorado 80303). *Journal of Chemical Physics;* **79**: No. 9, 4448-4458(1 Nov 1983).

Simulated scattered light intensity plots are calculated for a soft sphere inverse-12 system subjected to a shear and are compared to experimental plots for a colloidal suspension under approximately equivalent conditions. The simulated plots were obtained by a Fourier transform of the radial distribution function. The two sets show points of striking similarity: The Debye—Scherrer rings become elliptical when both systems are subjected to the shear, and the light intensity around the rings is a function of polar angle. An interesting feature is the degree to which the experimental plots display non-Newtonian characteristics of the suspension. Overall, the work is a direct comparison of the results of a computer simulation with real experimental data. Suggestions for future work are given.

3606 **Compressibility effect on instability growth rates.** Newcomb, W.A. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550 and Department of Applied Science, University of California, Davis, California 95616). *Physics of Fluids;* **26**: No. 11, 3246-3246(Nov 1983). Contract W-7405-ENG-48.

For an arbitrary magnetostatic equilibrium, instability growth rates are shown to be an increasing function of compressibility.

3607 **Effective mass and the specific heat of normal liquid $^3$He.** Mishra, V.K.; Brown, G.E.; Pethick, C.J. (Department of Physics, State University of New York at Stony Brook, Stony Brook, New York). *Journal of Low Temperature Physics;* **52**: No. 5, 379-408(1 Sep 1983). Contract AC02-76ER13001.

The behavior of the specific heat of liquid $^3$He as a function of temperature implies a rapid variation of effective mass with energy. Recently a model has been developed for understanding this. In this paper we extend this model to explain the low-temperature (T< or =100 mK) specific heat measurements of normal liquid $^3$He by Greywall. We find that the model gives a reasonably accurate description of the data in this temperature range.

**3608 Thermal expansion, velocity of sound, and compressibility in liquid $^3$He under pressure.** Roach, P.R.; Eckstein, Y.; Meisel, M.W.; Aniola-Jedrzejek, L. (Solid State Science Division, Argonne National Laboratory, Argonne, Illinois). *Journal of Low Temperature Physics;* **52**: No. 5, 433-448(1 Sep 1983).

We have measured the pressure at constant volume P/sub v/ (T), of liquid $^3$He as a function of temperature from 10 to 600 mK and at starting pressures from 1.6 to 28.1 bar. Simultaneously, we determined the hydrodynamic sound velocity $c_1$, at the same pressures and temperatures. From these data we have derived very accurate values of the isobaric expansion coefficient α/sub p/ and the adiabatic compressibility k.

**3609 Mass spectra and ionization temperatures in an argon-nitrogen inductively coupled plasma.** Houk, R.S.; Montaser, A.; Fassel, V.A. (Ames Laboratory-U. S. Department of Energy and Department of Chemistry, Iowa State University, Ames, Iowa 50011). *Applied Spectroscopy;* **37**: No. 5, 425-428(Sep 1983). Contract W-7405-ENG-82.

Positive ions were extracted from the axial channel of an inductively coupled plasma (ICP) in which the outer gas flow was Ar, $N_2$, or a mixture of Ar and $N_2$. Addition of $N_2$ to the outer gas decreases the electron number density (n/sub e/) in the axial channel. $Ar^{+2}$, $O_2^+$, and $ArH^+$ react with N-containing species in the plasma and/or during the ion extraction process. $Ar^+$ remains abundant even if there is no Ar in the outer gas, which indicates the probable occurrence of charge transfer reactions between $N_2^+$ and Ar. The present work corroborates two general concepts upon which several theories of theorigin of suprathermal ionization in ICPs are based: (a) species are physically transported from the induction region to the axial channel; and (b) these species may react with a ionize neutral species in the axial channel. Ionization temperatures (T/sub ion/) measured from the ratio $Cd^+/I^+$ were 5750 to 6700 K for a $N_2$ outer flow ICP a forward power of 1.2 kW. This T/sub ion/ range is significantly below that obtained for an Ar outer gas ICP under otherwise similar operating parameters.

**3610 Time evolution of density perturbations in accelerating stratified fluids.** Mikaelian, K.O. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physical Review [Section] A: General Physics;* **28**: No. 3, 1637-1646(Sep 1983). Contract W-7405-ENG-48.

We consider N superimposed fluids, having arbitrary initial perturbations at their N-1 interfaces, undergoing a Rayleigh-Taylor instability with constant acceleration. The time evolution of these perturbations is described by a sum over normal modes and in general is a combination of oscillation and exponential rise. We derive the equation governing their growth, discuss the case N = 3 analytically, and give two numerical examples where we plot the time evolution of the perturbations at the four interfaces of five superimposed fluids. Our examples illustrate how the evolution depends on the density profile, on the wavelength of the perturbations, and on the initial conditions.

**3611 New representation of Navier-Stokes equations governing self-similar homogeneous turbulence.** Foias, C.; Manley, O.P.; Temam, R. (Indiana University, Bloomington, Indiana 47405). *Physical Review Letters;* **51**: No. 8, 617-620(22 Aug 1983). Contract AC02-82ER12049.

A new form of the Navier-Stokes equation resulting from a change of variables is presented. The new form has several advantages: It yields a new asymptotic behavior of the flow for long times and vanishingly small viscosity. In addition an interpretation of the new equation in terms of a simple random walk yields immediately not only the Kolmogorov (2/3)-power law but also an intermittency exponent well within the experimental uncertainty.

**3612 Quantum nucleation of solids.** Uwaha, M. (Department of Physics and Materials Laboratory, University of Illinois at Urbana-Champaign, Urbana, Illinois). *Journal of Low Temperature Physics;* **52**: No. 1, 15-40(1 Jul 1983). Contract AC02-76ER01198.

Quantum nucleation of solid $^4$He from superfluid $^4$He is discussed on the basis of a simple isotropic model. The nucleation rate is evaluated in the semiclassical WKB approximation developed earlier by Lifshitz and Kagan. The rate very strongly depends on the magnitude of overpressurization. The effect of a substrate that is characterized by a surface tension is examined; since the substrate reduces the liquid kinetic energy, the nucleation rate is substantially increased when the contact angle is small. The same method is applied to the two-dimensional nucleation of a new atomic layer on a singular face, with the result that the rate is very small under usual conditions.

**3613 Rayleigh—Taylor instability and the use of conformal maps for ideal fluid flow.** Menikoff, R.; Zemach, C. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Computational Physics;* **51**: No. 1, 28-64(Jul 1983).

Potential theory permits ideal fluid dynamics to be formulated in terms of boundary motion. In two dimension, the flow can then be found using conformal mapping. The evolution of some Rayleigh—Taylor instabilities is calculated well into the large amplitude nonlinear regime. The Rayleigh—Taylor calculation for Atwood ratio unity is used as a prototype for a system of theoretical and numerical techniques exploting complex variable theory and high-order quadrature methods.

**3614 Transient behavior of rotating superfluid helium.** Campbell, L.J.; Krasnov, Y.K. (Los Alamos National Laboratory, Los Alamos, New Mexico). *Journal of Low Temperature Physics;* **49**: No. 3, 377-396(1 Nov 1982).

A hydrodynamic analysis of rotation experiments with superfluid helium shows that strong vortex interaction with the boundary must be included for the correct prediction of observed transients during spinup. It also appears that vorticity is created at a smooth boundary at the rate necessary to replenish the vorticity advected away, but is created at a greater rate if the boundary is rough. History-dependent effects are explained on the basis of a remnant vortex density. New experiments are proposed to measure the vortex—boundary interaction.

## 6450 High Energy Physics

**3615 High-energy physics.** Creutz, M. (Brookhaven National Laboratory, Upton, New York). *Physics Today;* **36**: No. 5, 35-43(May 1983). Contract AC02-76CH00016.

Experimentalists in particle physics have long regarded computers as essential components of their apparatus and now theorists are finding that significant advances in some areas can only be accomplished in partnership with a machine.

## 6451 Particle Interactions And Properties - Experimental

*REFER ALSO TO CITATION(S) 3121, 3145, 3166, 3533, 3534, 3813, 3858, 3861, 3906*

**3616 (BNL—33677) Quark search at the CBA.** Larsen, R.C.; Leipuner, L.B.; Morse, W.M.; Adair, R.K.; Kasha, H.; Schmidt, M.P. (Brookhaven National Lab., Upton, NY (USA)). 13 Mar 1983. Contract AC02-76CH00016. 10p. NTIS, PC A02/MF A01. Order Number DE84001459.

An experiment to search for quarks at the CBA is described. The cross sections for the production of massive quark-antiquark pairs in nucleon-nucleon interactions is estimated, and the experimental design and procedures are described. (WHK)

**3617 (CERN—83-02-Vol.2, pp 433-442) Hadron physics at the SPS: Theoretical remarks.** Petronzio, R. (European Organization for Nuclear Research, Geneva (Switzerland)). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

A few simple remarks are given about the relevance of the present experimental programme of hadron physics at the fixed-target SPS for quantitative tests of quantum chromodynamics.

3618 (CERN—83-02-Vol.2, pp 1-12) **Nucleon structure functions.** Eisele, F. (Dortmund Univ. (Germany, F.R.)). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

In this talk I summarize ideas and plans which have been put forward by members of all collaborations running muon or neutrino experiments at CERN. During our discussions there was general agreement that: i) substantial improvements of structure function measurements in the SPS range are still possible and necessary and ii) it is the responsibility of the present groups and of CERN to provide a "final" set of structure functions in the present energy range.

3619 (CERN—83-02-Vol.2, pp 128-145) **Neutrino oscillations at CERN.** Vannucci, F. (Paris-6 Univ., 75 (France). Lab. de Physique Nucleaire et de Hautes Energies). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

The author reviews the experimental search for neutrino oscillations at CERN.

3620 (CERN—83-02-Vol.2, pp 190-221) **Charm physics at the SPS; Now until approximately 1990.** Geist, W.; Reucroft, S. (European Organization for Nuclear Research, Geneva (Switzerland)). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

A review is given of the existing charm programme at the SPS and some future options are discussed. The SPS programme is put into the context of the existing knowledge on charm properties and the associated mysteries.

3621 (CERN—83-02-Vol.2, pp 222-249) **Search for beauty particles at the CERN SPS.** Sacton, J. (Interuniversity Inst. for High Energies, Brussels (Belgium)). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

The present status of our experimental knowledge on B-hadron decay and production processes is briefly reviewed. Some ideas are presented on how the future research programme on B-particles could evolve at the CERN SPS.

3622 (CERN—83-02-Vol.2, pp 250-269) **Search for massive neutrinos, axions and SUSY particles at CERN SPS energies.** Barbiellini, G. (European Organization for Nuclear Research, Geneva (Switzerland)). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

The author reviews the experimental search for massive neutrinos, supersymmetric particles, and axions at the CERN SPS.

3623 (CERN—83-02-Vol.2, pp 280-314) **Hard scattering and jet physics in connection with real photons.** Pretzl, K.P. (Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.)). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

This report contains a summary of the physics discussed in the working groups on (a) jet physics at the SPS in hadron-hadron collisions, (b) hard scattering with incident real photons and (c) large psub(T) prompt photons in hadron-hadron collisions.

3624 (CERN—83-02-Vol.2, pp 462-476) **Experiments with nuclear beams and targets.** Albrow, M.G. (Science Research Council, Chilton (UK). Rutherford and Appleton Labs.). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

After a general introduction to the fundamental interest of studying high energy nucleus-nucleus collisions, some specific signatures of quark-gluon plasma formation are considered from an experimental viewpoint. We then discuss the use of existing and new detectors for an experimental programme at the SPS.

3625 **(DESY—83-034) Inclusive production of electrons and muons in multihadronic events at PETRA.** D'Agostini, G.; Apel, W.D.; Engler, J.; Fluegge, G.; Fries, D.C.; Fues, W.; Gamerdinger, K.; Hopp, G.; Kuester, H.; Mueller, H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). May 1983. 24p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83751350.

The production of prompt leptons at PETRA has been measured for c.m. energies of 14, 22 and 34 GeV. The rate of prompt electrons and muons is presented, including a determination of the semileptonic branching ratio of the c and b quarks. Systematic effects due to changes in fragmentation and other model parameters have been studied.

3626 **(DESY—83-037) Gluon fragmentation in T(1S) decays.** Bienlein, J.K. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). May 1983. 11p. (CONF-830140—8). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83751352.

From 18. Rencontre de Moriond conference; La Plagne, France (23 Jan 1983).

In Y(1S) decays most observables (sphericity, charged multiplicity, photonic energy fraction, inclusive spectra) can be understood assuming that gluons fragment like quarks. New results from LENA use the (axis-independent) Fox-Wolfram moments for the photonic energy deposition. Continuum reactions show 'standard' Field-Feynman fragmentation. Y(1S) decays show a significant difference in the photonic energy topology. It is more isotropic than with the Field-Feynman fragmentation scheme. Gluon fragmentation into isoscalar mesons (a la Peterson and Walsh) is excluded. But if one forces the leading particle to be isoscalar, one gets good agreement with the data.

3627 **(DESY—83-039) Recent results from Jade on electroweak interactions.** Naroska, B. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). Jun 1983. 17p. (CONF-830231—6). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83751353.

From Europhysics study conference on electroweak effects at high energies; Erice, Italy (1 Feb 1983).

The Jade collaboration has performed measurements at Petra at an average center-of-mass (cms) energy of W approx.= 35 GeV in order to test Quantum Electrodynamics (QED) and electroweak theories. QED tests are still possible because the influence of the neutral weak current is negligible in many places, e.g. in $e^+e^- \rightarrow \gamma\gamma$, or in the total cross sections for $e^+e^- \rightarrow e^+$esup(,) $\gamma\gamma$, $\mu^+\mu^-$, and tau$^+$tau$^-$. On the other hand the interference of the electromagnetic and the weak amplitudes leads to an asymmetry in the angular distributions of $\mu^+\mu^-$ and tau$^+$tau$^-$, which was established for the first time at Petra. The measurements can be compared to predictions of electroweak theories, in particular the 'standard model' of Glashow, Salam, and Weinberg, which has successfully described neutral current phenomena in neutrino scattering and polarized e-d scattering. The tests at Petra were performed at a $Q^2$ much higher than previously available.

3628 **(IFUSP-P—310) Large missing-mass clusters in hydrodynamical approach.** Hama, Y.; Pottag, F.W. (Sao Paulo Univ. (Brazil). Inst. de Fisica). Dec 1981. 22p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704280.

The previously proposed hydrodynamical description of the large missing-mass systems in hadron-hadron collisions is applied to analysing recent large-mass data obtained at ISR. The results are still consistent with the data, indicating the usefulness of the large-cluster concept.

**3629 (IFVE-OEIPK—82-153) Energy and quantum number fluxes in $K^+p$ and $\pi^+p$ interactions at 32 and 70 GeV/c.** Azhinenko, I.V.; Belokopytov, Yu.A.; Vorob'ev, A.P. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 21p. (In Russian). (SERP-E—78/E-043). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700054.

Energy dE/dlambda, charge dQ/dlambda and strangeness dS/dlambda fluxes in $K^+p$ interactions at 32 and 70 GeV/c, and $\pi^+p$ interactions at 32 GeV/c are studied in terms of the angular variable lambda=x/psub(T) (psub(T) is the transverse momentum, x is the Feynman variable). The data on dQ/dlambda and dE/dlambda are practically energy independent between 32 and 70 GeV/c and do not depend on incident particle. For inclusive non-diffractive, inclusive diffractive and exclusive non-diffractive jets, the fraction of charge in any angular region $\Delta\Omega$ away from the central region is found to be proportional to the energy flux in the same interval. The data on dQ/dE versus lambda are compatible with some versions of dual models and agree also with the Lund Monte-Carlo model. In exclusive channels the average ratio dQ/dS is different from unity and amounts to dQ/dS = 0.78+-0.04, thus showing different probability for the kaon valence anti s and u quark fragmentations. The dQ/dlambda and dE/dlambda distributions in nondiffractive $K^+p$ reactions and $\nu$(anti $\nu$)p interactions are found to be very similar.

**3630** (INIS-mf—8474, pp 39-51) **Neutron-antineutron oscillations from an experimental point of view.** Baldo-Ceolin, M. (Padua Univ. (Italy). Ist. di Fisica; Istituto Nazionale di Fisica Nucleare, Padua (Italy)). 1982. NTIS (US Sales Only), PC A09/MF A01. (CONF-820675—Vol.3).

From International conference on neutrino physics; Balaton, Hungary (14 Jun 1982).

The grand unified gauge theories of elementary particle interactions predict the nonconservation of baryon number. This leads to the possibility of neutron-antineutron mixing and oscillation. Recent experiments for detecting these oscillations, their basic concepts and preliminary results, new limits on oscillation parameters are described. Two main methods: static experiments, using neutrons bounded in nuclei analysed by measuring the nuclear effects of neutron-antineutron oscillation; and dynamic ones using neutrons of artificial sources analysed by modifying external magnetic field are discussed. (D.Gy.).

**3631** (INIS-SU—180, pp 140-153) **Search for neutrino oscillations: present experimental data and future experiments.** Klajn, D.R. (Wisconsin Univ., Madison (USA)). 1981. NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

The analysis of neutrino oscillations for the three neutrino system and present experimental data are reviewed. The solar neutrino experiment, reactor experiments, and deep mine experimental data provide evidence for oscillations. Three broad classes of solutions are found. Using these clues definite experiments to discover neutrino oscillations and to measure the parameters of the lepton mixing are discussed.

**3632 (IPNO-TH—82-46) New ISR and collider anti p-p and p-p data and asymptotic theorems.** Nicolescu, B. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Oct 1982. 14p. (CONF-8208103—3). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704281.

From 4. European symposium on anti NN and anti QQ interactions; Santiago de Compostella, Spain (30 Aug 1982).

We present a general discussion of the rigorous finite-energy effects of asymptotic theorems, with a special emphasis on the confrontation with the new ISR and collider antipp and pp total cross-section data. We point out the possible existence of a minimum in the difference between the antipp and pp total cross-sections.

**3633 (ITEF—103(1982)) Search for events having six quarks in the final state.** Aleshin, Yu.D.; Kiselevich, I.L.; Mel'nichenko, I.A.; Mikhajlichenko, V.I.; Nikitin, S.Ya.; Shkarlet, V.D.; Shidlovskij, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1982. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700055.

Search for events related to $pp \rightarrow \Lambda\Lambda K^+K^+$ reaction is carried out by means of a liquid-hydrogen chamber, irradiated by 7.8 GeV/c proton "pencil" beam. Events, related to the above reaction, have not been detected in the experiment. The obtained upper boundary of cross section is 460 nb.

**3634 (JINR—D-1-82-895) Charmed baryon Asub(c)sup(+) production by approximately 58 GeV neutrons on carbon.** Aleev, A.N.; Arefiev, V.A.; Balandin, V.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1982. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700056.

The production of the charmed baryon Asub(c)sup(+) by approximately 58 GeV neutrons on carbon is observed. The decay modes detected are: Asub(c)sup(+) → anti $K^0p\pi^+\pi^-$ and Asub(c)sup++) → $\Lambda^0\pi^+\pi^+\pi^-$. The product of the model-dependent partial cross section and its decay probabilities are 31+-4 $\mu$b and 6.9+-1.3 $\mu$b per carbon nucleus, respectively. A lower limit for the inclusive cross section of Asub(c)sup(+) production (taking into account all models considered) at $x > 0$ is found to be about 100 $\mu$b per carbon nucleus at a 90% confidence level. The systematic errors are approximately 45%.

**3635 (JINR—E-1-82-847) Electroweak asymmetry in deep inelastic muon-nucleon scattering.** Argento, A.; Benvenuti, A.C.; Bollini, D. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1982. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700057.

A deep inelastic $\mu$N scattering cross section asymmetry at momentum transfers $Q^2$ ranging from 15 to 180 $GeV^2$ have been measured. The results is in quantitative agreement with the WS/GIM standart electroweak model and allows one to determine the muon neutral current couplings. The interference between the weak and electromagnetic currents has been observed for the first time in the muon-quark interaction. The quantitative interpretation of the results relies on the validity of the quark parton model and the radiative corrections. The mixing angle of the standard WS/GIM model is sinsup(2)thetasub(W)=0.23+-0.07 (stat.) +- 0.04 (syst.).

**3636 (JINR—R-1-82-334) Study on the dimensions of the radiation region of secondary negative pions produced in $\pi$pN and $\pi^-$C interactions at 40 GeV/c in different reference frames.** Angelov, N.; Akhababyan, N.; Grishin, V.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1982. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700058.

Dimensions of the emission region in $\pi^-$p, $\pi^-$n and $\pi^-$C interactions at 40 GeV/c are determined by the method of interference of identical secondary particles. It is found that for pion-nucleon collisions a minimum of this region manifests itself in the "quark" reference frame, which is indicative of a dominant role of one-quark interactions in multiparticle processes. In pion-nucleus collisions a minimum of the emission region of secondary pions is shifted to the $\pi^-$N c. m. s. It is interpreted as a multiquark interaction contribution increase in this processes.

**3637 (JINR—R-1-82-559) Change of space-time characteristics of radiation region of secondary $\pi$p-mesons produced in pion-nucleon interactions at 40 GeV/c on reference frame.** Angelov, N.S.; Akhababyan, N.O.; Grishin, V.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1982. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700059.

From an analysis of the experimental data on multiparticle production in pion-nucleon interactions at 40 GeV/c a dependence of the space-time lsub(i) parameter dimensions of the secondary $\pi^-$-esmission region of the Lorentz-factor $\gamma$ of a given reference frame

is established. The obtained dependences lsub(i)=f(γ) of the parameters lsub(i) show up extrema, shifted from the "π-N" c. m. s. towards the c. m. s. of the colliding quarks. This fact may be interpreted as a manifestation of the quark structure of the primary hadrons in multiple processes.

3638 **(JINR—R-1-82-887) Differential cross section of eta meson production on carbon by πp mesons at the momentum of 3.3 GeV/c.** Arkhipov, V.V.; Astvatsaturov, R.G.; Knapik, E.; Malakhov, A.I.; Melkumov, G.L.; Plyashkevich, S.N.; Khachaturyan, M.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1982. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700060.

$\pi^-$ Asub(Z) → etaAsub(Z-1) differential cross section has been measured on carbon nuclei at 3.3 GeV/c pion momentum in range of squared momentum transfer -t from tsub(min) to -0.4 $(GeV/c)^2$. The results are compared with the previous ones, obtained during the measurements of the reaction $\pi^- p \rightarrow$ etan with liquid-hydrogen target. In the differential cross section for the reaction on carbon a minimum in the forward direction, much deeper than for hydrogen was observed. In the framework of incoherent particle production theory the measured effective number of protons in carbon nuclei is Zsub(eff)sup(C)=3.2+-0.7. The experimentally determined Zsub(eff)sup(C)(t) dependence for 0<-t<0.4 $(GeV/c)^2$ is presented.

3639 **(JINR—R-4-82-633) μ-capture in a liquid hydrogen.** Bakalov, D.D.; Vinitskij, S.I.; Ponomarev, L.I.; Men'shikov, L.I.; Fajfman, M.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703990.

The capture of $\mu^-$-meson $\mu^- + p \rightarrow n + \nu_\mu$ in liquid hydrogen is considered allowing for the kinetics of ion-molecular and mesic molecular reactions. The conversion ortho-. para Ei-transition due to the particle spin interaction is shown to occur in the mesic molecule ppμ with the rate lambdasub(op)=(7.1 +- 1.2) x $10^4$ $s^{-1}$. The calculated μ-capture rate in liquid hydrogen equals Asub(c) = (494 +- 16) $s^{-1}$.

3640 **(LA—9798-P) Physics with LAMPF II.** (Los Alamos National Lab., NM (USA)). Jun 1983. Contract W-7405-ENG-36. 436p. NTIS, PC A19/MF A01. Order Number DE83016338.

This report gives the scientific justification for LAMPF II, an upgrade of the 800-MeV LAMPF accelerator to a 16- or 32-GeV higher primary and secondary beam intensities available in this energy region, qualitatively new experiments will become possible in four main areas of physics: (1) nuclear physics, using both conventional strange-particle or antinucleon probes; (2) the strong interactions of few-hadron systems; (3) electroweak interactions, testing the Standard Model and its possible extensions with high-precision experiments and searches for rare decays; and (4) interdisciplinary studies, such as the investigation of solid-state properties using muons. The background and present status in each area are presented and compared with what can be done with LAMPF II. Each exposition is followed by preliminary proposals for particular experiments to be performed, exploiting LAMPF II's unique capabilities. Appendices describe design features of the LAMPF II accelerator and experimental areas as well as possible further expansions of LAMPF II into new areas of physics. Separate entries were made in the data base for the papers presented. (WHK)

3641 (LA—9798-P, pp 46-50) **Radiative kaon capture.** Hynes, M.V. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Unlike radiative pion capture, radiative kaon capture is an almost unexplored field. The importance of this work arises from its potential contribution to our understanding of low-energy K-n and Λ-N scattering parameters. A measurement of the reactions K anti p → Λ γ and Σγ is proposed. A novel technique of final-state identification is employed that in principle allows for the detection of the Dalitz pair process as well. The importance of beams with high purity and flux is discussed along with count-rate estimates.

3642 (LA—9798-P, pp 54-59) **Hypernuclei.** Gibson, B.F. (Los Alamos National Lab., NM); Stein, N.; Dover, C.B. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The uses of kaon beams for producing hyperons and hypernuclei and the uses of hyperons as probes of nuclear structure are discussed. (WHK)

3643 (LA—9798-P, pp 60-65) **Search for a possible strangeness S = -2 dibaryon.** Barnes, P.D. (Carnegie-Mellon Univ., Pittsburgh, PA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

We discuss a proposed search for a bound six-quark state. The methods are ideally suited for LAMPF II in view of the high-flux $K^-$ beams expected. The event rates discussed are marginal with a $K^-$ flux of 4 x $10^5$/s but would become quite practical at LAMPF II with $K^-$ fluxes of ~ $10^7$/s near 1.8 GeV/c.

3644 (LA—9798-P, pp 66-68) **Search for strange dibaryons at KEK and LAMPF II.** Masaike, a. (National Lab. for High Energy Physics, Oho, Ibaraki, Japan). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A possible experiment to search for strange dibaryon H is described. It is pointed out that, at present, the KEK-K2 beam line is the best facility in the world for such an experimental effort. However if the cross section for the production of these dibaryons were less than 10 nb, higher $K^-$ beam intensities, such as those likely to become available at LAMPF II, will be needed.

3645 (LA—9798-P, pp 69-73) **Weak decay of lambda hypernuclei.** Barnes, P.D.; Grace, R. (Carnegie-Mellon Univ., Pittsburgh, PA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Investigations of the weak decay mechanisms of lambda hypernuclei have been discussed in the literature for a few light nuclei. These studies are generally very limited in scope and suffer from poor statistics. Preparations are currently in progress to study all the major weak decay modes of $^{12}C$ at the AGS but these too are severely hampered by the low kaon flux available. It is clear that the opportunity to learn about the four fermion weak interaction with strangeness-changing currents will not be fully exploited until the high-flux K beams at a facility like LAMPF II become available. We discuss the physics motivation and experimental requirements of the AGS measurements as an example of what can be done now for $^{12}C$. A much lighter and heavier hypernucleus would also be of great interest but current fluxes make this very difficult to pursue.

3646 (LA—9798-P, pp 74) **Experiments with Λ hypernuclei.** Chrien, R.E. (Brookhaven National Lab., Upton, NY). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

An experiment to measure precisely the p/sub 3/2/ - p/sub 1/2/ Λ-nucleus energy difference in $^{13}C$ is described. Increased flux and better quality of the kaon beams at LAMPF II are expected to make such precise measurements possible.

3647 (LA—9798-P, pp 75-77) **Measurement of $^{13}C$ magnetic moment.** Funsten, H.O. (Coll. of William and Mary, Williamsburgh, VA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

It is proposed to use the polarizing ($K^-$, $\pi^-$) reaction to yield $^{13}C$ polarized perpendicular to the scattering plane. Precession of $^{13}C$ in a 100-kG superconducting solenoid will be determined by a scintillator array that detects the weak decay $\pi^-$. From this the magnetic moment of $^{13}C$ will be determined.

3648 (LA—9798-P, pp 78-82) **Possible investigations of the ($K^-$, $K^+$) reaction.** Hungerford, E.V. (Univ. of Houston, TX). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Production of S = -2 hypernuclei through a one-step process such as ($K^-$, $K^+$) is examined. The proposed LAMPF II facility

would provide the higher $K^-$ beam intensities required for the studies of such low cross-section reactions.

3649 (LA—9798-P, pp 83-84) **Studies of narrow Σ-hypernuclear structure.** Hungerford, E.V. (Univ. of Houston, TX). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A high flux $K^-$ beam of good purity will facilitate narrow Σ-hypernuclear structure studies through the $(K^-,\pi^-)$ reaction.

3650 (LA—9798-P, pp 85-88) **How to populate bound hypernuclear levels.** Majling, L. (Nuclear Physics Inst. Academy of Science, Prague, Czechoslovakia); Zofka, J.; Fetisov, V.N.; Eramzhyan, R.A. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Based on nucleon decays of hypernuclear resonances from (K⁻,π/sup anti 0/) reactions, an alternative for populating the lower part of hypernuclear spectra is suggested. The emitted nucleons reveal structure of the resonances. The subsequent production of various hypernuclear γ-quanta and their applicability is discussed.

3651 (LA—9798-P, pp 89-91) **Hadronic atoms: the hadron-nucleus strong interaction.** Leon, M. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Hadronic atoms can give valuable information on negative hadron-nucleus strong interaction. We discuss some of the developments in this area that can be expected at LAMPF II.

3652 (LA—9798-P, pp 92-93) **$K^-$ and $\Sigma^-$ atoms and $p(K^-,\gamma)$.** Roberts, B.L. (Boston Univ., MA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

We discuss $K^-$ and $\Sigma^-$ hadronic x-ray experiments and radiative kaon capture at a kaon factory.

3653 (LA—9798-P, pp 94-95) **Sigma-minus hydrogenic atoms.** Welsh, R.E. (Coll. of William and Mary, Williamsburg, Va); Kunselman, R. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The use of tagged $\Sigma^-$'s for $\Sigma^-$-hydrogen x-ray experiments is discussed.

3654 (LA—9798-P, pp 96-98) **High-precision studies of exotic x rays from hadronic atoms with crystal diffraction spectrometers.** Lu, D.C. (Yale Univ., New Haven, CT). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The possibilities for high-precision studies of $\pi^-$, $K^-$, anti p, $\Sigma^-$, $\Xi^-$, and $\Omega^-$ x rays using crystal diffraction spectrometers and a target adjacent to the LAMPF II beam dump, are discussed.

3655 (LA—9798-P, pp 99-100) **Studies of the E2 nuclear resonance effect in kaonic atoms.** Reidy, J.J. (Univ. of Mississippi, University). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Kaonic x-ray experiments involving the E2 nuclear resonance effect, and their significance, are discussed.

3656 (LA—9798-P, pp 101-103) **Measurement of two-nucleon absorption rates in $K^-$ absorption at rest.** Seki, R. (California State Univ., Northridge). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Measurements of products that result from absorption of stopped $K^-$ by two nucleons are proposed. From the measurements we expect to obtain information useful for understanding nuclear correlations in the nuclear surface.

3657 (LA—9798-P, pp 139-145) **Formation and decay of kaon-nucleon resonances in light nuclei: a test of excited-state quark wave functions.** Liu, L.C. (Los Alamos National Lab., NM); Plendl, H.S.; Albright, J.R.; Huettmeier, U.J.; Lieb, B.J. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

We propose to measure the lifetimes of the excited states of λ and Σ hyperons inside nuclei by detecting products from the hyperon decay in coincidence either with prompt gammas from the residual nucleus or with the recoil of the residual nucleus. Results of our study will make it possible to test quark wave functions of the excited states of the SU(6) x 0(3) model.

3658 (LA—9798-P, pp 156) **Strong interactions: few hadron systems.** Bonner, B.E.; Gibbs, W.R. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The studies considered in this section are the fundamental ones for the investigation of quark and gluon degrees of freedom. The variety of systems that can be formed copiously is truly impressive. Indeed a very large number of quark combinations are possible.

3659 (LA—9798-P, pp 157-159) **Antinucleon-nucleon physics.** Bonner, B.E. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The expected antiproton flux in a time-separated beam at LAMPF II is shown graphically. Examples of experiments that can be addressed uniquely at LAMPF II are given, and a comparison is made between the event rates expected at LEAR and LAMPF II for the textbook measurement of the electromagnetic form factor of the proton in the time-like region. (WHK)

3660 (LA—9798-P, pp 160-161) **Study of charmonium states.** Bonner, B.E. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A strong case is made that the intense time-separated antiproton beam of LAMPF II would enable measurements of the widths of some of the chi states of charmonium. This would provide stringent constraints on quantum chromodynamics calculations.

3661 (LA—9798-P, pp 162-164) **Tagged antineutron experiments.** Dieterle, B. (Univ. of New Mexico, Albuquerque). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Antineutron beams having $\Delta p/p$ of 1% and a flux of $\geqq 10^4$/s will be available for the first time at LAMPF II. Antineutron-nucleon scattering experiments and new particle searches at the level of 10 μb can be performed using this facility. The tagged beam described here is lower in intensity than what could be produced, but has clean rejection of gammas and neutrons.

3662 (LA—9798-P, pp 165-167) **p anti p → $l^+l^-$: a LAMPF II proposal.** Glass, G. (Texas A & M Univ., College Station). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Lepton pair-production experiments from proton-antiproton annihilation will become feasible at the energy and intensities proposed for LAMPF II. A measurement of the proton form factor in the time-like momentum-transfer region will provide a test of dispersion relations and deepen our understanding of the vector meson's contributions to the proton form factor. Tests of quantum electrodynamics will also benefit from these experiments.

3663 (LA—9798-P, pp 168-172) **Studies of anti NN polarization experiments at LAMPF II.** Simmons, J.E. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Polarization experiments in the anti NN system at the future LAMPF II accelerator have the potential for increasing knowledge of the nuclear force and resonance phenomena at GeV energies. The high anti p beam intensity allows the possibility for generation of usable polarized anti p beams by scattering. A survey of existing anti p p analyzing power experiments is given. Some future experiments with polarized targets, including possible, new spin-correlation experiments employing a polarized anti p beam, are discussed.

3664 (LA—9798-P, pp 173-174) **Search for mesons in the mass range 2.5 to 5 GeV/c².** Wolfe, D. (Univ. of New Mexico, Albuquerque). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

An accumulator-storage ring arrangement with very small $\Delta p/p$, similar to the situation at CERN, is suggested and recommended for future anti p physics at LAMPF II.

3665 (LA—9798-P, pp 175-176) **Hyperon-nucleon interactions.** Gibson, B.F. (Los Alamos National Lab., NM); Oostens, J. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

One of the fundamental questions facing physicists today is that of how we unify the basic forces of nature: gravitational, electromagnetic, strong nuclear, and weak nuclear. Some headway toward achieving that goal has been attained, but more data are needed concerning the strong force. To that end one wishes to study the hyperon-nucleon (YN) interaction in the same vein that the nucleon-nucleon (NN) interaction has been explored. In addition, one wishes to investigate the structure of hypernuclei to understand the details of this new form of nuclear matter. To do so, one is driven to study the YN interaction to model even the simplest of hypernuclei, just as one requires reasonable knowledge of the NN force to make significant model statements about conventional nuclei. Experimental data needs on YN scattering are discussed. (WHK)

3666 (LA—9798-P, pp 177-179) **Spectroscopy of strange dibaryons with $K^- d \rightarrow \Lambda p \pi^-$ reaction.** Hungerford, E.V.; Piekarz, H. (Univ. of Houston, TX). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Studies of the lowest strange dibaryons with $K^- d \rightarrow \Lambda\, p\pi^-$ reaction are proposed.

3667 (LA—9798-P, pp 180-185) **ΞN scattering as a probe of the strong interaction.** Hynes, M.V. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The hitherto successful treatment of the nucleon-nucleon force by boson exchange models using a basically Yukawa-like description did not recognize that nucleons are extended structures containing quarks and gluons. The central issue today is what new physical content, if any, do we introduce when quarks are used in nuclear physics. The experiment proposed here uses the strange quark as a tracer that can be followed easily through the dynamics of a hyperon-nucleon scattering process. The $(K^-,K^+)$ reaction on a proton target will be used to produce $\Xi^-$ hyperons. The subsequent interaction of the $\Xi^-$ with the protons in the target will be reconstructed from the decay products. This production mechanism yields $\Xi^-$ hyperons polarized perpendicular to the production plane. The measurement of the spin-averaged and spin-aligned cross sections proposed here will provide an important determination of the success or failure of one-boson or one-quark exchange descriptions. Count rate estimates show that this experiment would require $10^4$ h of $K^-$ beam at currently available fluxes. At LAMPF II fluxes it would require 100 h.

3668 (LA—9798-P, pp 186-190) **Are there bound A = 2 hyperon states.** Bozoian, M.; van Doremalen, J.C.H.; Weber, H.J. (Univ. of Virginia, Charlottesville). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

One-boson-exchange potentials for ΛN, $\Sigma^+p$, ΛΛ, and ΞN elastic scattering at E/sub lab/ ≧ 150 MeV are calculated, including renormalizations from two-boson exchanges. The model is derived from a quark pairing mechanism that has been tested previously for elastic NN scattering. The resulting phase shifts and effective range parameters are compared with data and other phenomenological potentials for ΛN and $\Sigma^+p$ systems, and reasonable agreement is achieved. In the ΛΛ and ΞN channels, deuteron-like bound states may exist.

3669 (LA—9798-P, pp 191-192) **Antihyperon-nucleon scattering.** Riley, P.J. (Univ. of Texas, Austin). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

At LAMPF II we propose elastic and inelastic antihyperon- and hyperon-nucleon scattering measurements, such as $\Lambda^0$N, anti $\Lambda^0$N, ΣN, anti Σn, and anti ΞN. The measurements will use hyperon beams produced by the pair-creation p anti p → YY interaction, where Y = Λ, Σ, Ξ, using the LAMPF II time-separated antiproton beam.

3670 (LA—9798-P, pp 193-195) **Nucleon-nucleon interactions: quark dynamics.** Lomon, E.L. (Massachusetts Inst. of Tech., Cambridge). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Present-day particle theory describes hadrons as systems of quarks bound by gluon exchange and suggess that the resultant degrees of freedom should be important (and may even dominate) at ranges as large as about 1 fm. That quark degrees of freedom have not been dramatically manifest in medium-energy particle and nuclear experiments to date may be tentatively attributed to the relatively low density of nuclei and the fact that until now accelerators could only explore with precision at the threshold of the critical range of momentum transfers and excitation energies. It is also possible that a duality of the hadron and quark descriptions in the vicinity of 1 fm obscures the onset of quark and gluon degrees of freedom. For these reasons one needs to extend the exploration by means of precise measurements at high-momentum transfers to determine where the hadronic description continues to be valid or alternatively where effects of quark degrees of freedom are important. Theoretical and experimental evidence exists to suggest that specific signatures of quark and gluon degrees of freedom may be manifest in experiments using beams of energy beginning at 1 GeV. The predicted multihadron quark bag states have not yet shown up as narrow states, due to their coupling to the continuum; but the zeros these states produce in the wave function near 1 fm have been identified by detailed amplitude analyses of meson-meson, meson-nucleon, and nucleon-nucleon experiments.

3671 (LA—9798-P, pp 196-199) **Nucleon-nucleon scattering above LAMPF energies.** Bhatia, T.S. (Los Alamos National Lab., NM); Yokosawa, A. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Some polarization experiments in nucleon-nucleon scattering above LAMPF energies are discussed. Polarized beams and targets at facilities such as SATURNE, KEK, AGS, and LAMPF II will permit such investigations.

3672 (LA—9798-P, pp 201-202) **Meson-nucleon systems.** Gibbs, W.R. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

One of our most powerful means of probing hadronic structure is through the study of the meson-nucleon system. The position of (indeed even the existence of) pion-nucleon resonances forms the initial basis of the quark model. Future QCD theories of confinement will predict the shapes of functions describing the distributions of quarks within the hadronic system. In present nomenclature, these might be described as the bag size and diffuseness. The strength and range of the interaction of each pion-nucleon partial wave thus gives precise, direct information about these fundamental theories.

3673 (LA—9798-P, pp 203-204) **Baryon spectroscopy.** Cutkosky, R.E. (Carnegie-Mellon Univ., Pittsburgh). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Low-energy hadron spectroscopy is the natural place to study quark and gluon confinement effects and other nonperturbative features of QCD. To test the theory adequately, precision data are called for. It is not enough to just look at the ground states (s-wave quarks or antiquarks). In fact, discrepancies with simple models (such as the bag model) already show up strongly at the quark-P-wave levels ($N^*$ and $\Delta^*$ with 1.5 GeV ≦ M ≦ 1.7 GeV). It has been known for some time that many properties of these states can be understood qualitatively in terms of a model with perturbing forces suggested by QCD (provided one leaves out the spin-orbit forces). More recent work has shown that there are also

definite deviations from the lowest order predictions of QCD and that additional corrections are needed that may be nonperturbative in origin. To understand these quark-P-wave baryons properly, it is desirable also to have good data on the next set of odd-parity states, up to about 2.5 GeV. Requirements for $\pi$-N experiments for baryon spectroscopy studies are discussed. (WHK)

3674 (LA—9798-P, pp 205-207) **Pion-nucleon physics at LAMPF II.** Hoehler, G. (Universitaet Karlsruhe, Germany). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

New experimental data for the reactions $\pi N \rightarrow \pi N$ and $\pi N \rightarrow N\pi\pi$ are mainly important for the study of three problems: (1) nucleon spectroscopy; (2) secondary terms of the asymptotic expansion; and (3) analytic continuation to the unphysical region. These problems are discussed.

3675 (LA—9798-P, pp 208-210) **Spin-rotation parameter in $K^+$-p elastic scattering near 1.5 GeV/c.** Igo, G. (Univ. of California, Los Angeles). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The measurement of the spin-rotation angle $\beta$ is proposed in $K^+$-p and $\pi^+$-p elastic scattering at 1.0-, 1.25-, and 1.5 GeV/c incident momenta.

3676 (LA—9798-P, pp 211-212) **Elastic $K^+N$ scattering.** Bhatia, T.S. (Los Alamos National Lab., NM); Glass, G. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

High-intenstiy $K^+$ beam at LAMPF II with low pion contamination will permit high-precision $K^+N$ studies.

3677 (LA—9798-P, pp 213-218) **Low-energy $K^-p$ interactions.** Miller, D.J. (University Coll., London, England). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The importance of complete high-statistic $K^-p$ experiments, at rest and across the cusp region, is discussed.

3678 (LA—9798-P, pp 219) **Glueballs.** Glass, G. (Texas A & M Univ., College Station). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Gluons, the transmitters for the strong force, have yet to be established as particles that bind together without the presence of quarks. Such bound states or resonances, if they exist, are referred to as glueballs. Experiments are in progress to investigate these resonances and a LAMPF II program would add significantly to these studies.

3679 (LA—9798-P, pp 220-223) **Electroweak interactions.** Goldman, T. (Los Alamos National Lab., NM); Hoffman, C.M.; Mischke, R.E.; Lubatti, H.J. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The most exciting recent development in elementary particle physics has been the successful unification of the electromagnetic and the weak interactions. Presently, all experimental data on electroweak processes are consistent with the Glashow-Weinberg-Salam (GWS) or Standard Model, including the Glashow-Iliopoulos-Maiani (GIM) mechanism to suppress strangeness-changing neutral currents. However, as is discussed, many questions reamin. These questions dictate that we perform detailed tests of the Standard Model and that we search for evidence indicating whether the Standard Model requires modification or extension.

3680 (LA—9798-P, pp 224-226) **Neutrino reactions.** Rosen, S.P.; Carlini, R. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The extremely high neutrino flux at LAMPF II makes possible a set of important experiments that cannot be done at existing facilities. LAMPF II is an ideal facility for investigating the Lorentz structure of the leptonic neutral current, studying neutrino oscillations, observing the weak-charged neutral-current interference, and testing $\mu$-e universality.

3681 (LA—9798-P, pp 227-236) **Neutrino interactions with nuclei.** Walecka, J.D. (Stanford Univ., CA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

We examine tests of the Glashow-Weinberg-Salam (GWS) Standard Theory of Electroweak Interactions. The tests are model-independent in the sense that they are relations between experimental quantities that are direct consequences of the GWS theory, but they are independent of the detailed structure of the nucleus. Such relationships were anticipated by Weinberg. Neutrino reactions with nuclei are considered, focusing largely on charged-lepton production, and it is demonstrated that intermediate-energy neutrino reactions have a central and unique role to play in our understanding of semileptonic weak interactions. This point is illustrated by discussing a complete kinematic experiment on the nucleon. A discussion of what neutrino reactions could teach us about nuclear structure is also given. (WHK)

3682 (LA—9798-P, pp 243-244) **Possibility of observing nu p elastic scattering in a hydrogen bubble chamber at LAMPF II.** Hoffman, C.M. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The possibility of employing a hydrogen bubble chamber to observe nu p elastic scattering is discussed. In a chamber with a fiducial volume of 2 $m^3$, a cycle rate of one per second, a 60-Hz nu/sub mu/ beam produced by 400 $\mu$A of 4-GeV protons, and a $<E_{nu}> \simeq$ 500 MeV, the nu $\mu$p event rate would be approximately 20 per day. Backgrounds are also discussed.

3683 (LA—9798-P, pp 253-255) **Neutrino-electron elastic scattering.** Carlini, R. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A neutrino-electron elastic-scattering experiment is proposed for LAMPF II. The basic elastic reactions that could be studied are presented, and the implications of such studies are discussed. Two experimental approaches are detailed.

3684 (LA—9798-P, pp 256-260) **Neutrino physics at LAMPF II with a liquid time projection chamber detector.** Allen, R.C.; Chen, H.H.; Doe, P.J.; Hausammann, R.; Mahler, H.J.; Wang, K.C. (Univ. of California, Irvine). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

We suggest the use of a liquid time projection chamber to study neutrino-electron and neutrino-proton elastic scattering and neutrino oscillations at LAMPF II. The essential ideas, with an estimate of rates, are discussed.

3685 (LA—9798-P, pp 274-276) **Experiment to measure the decay K/sub $L/^0 \rightarrow \pi^0 e^+ e^-$.** Littenberg, L. (Brookhaven National Lab., Upton, NY). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The design of an experiment to measure the CP-violating decay K/sub $L/^0 \rightarrow \pi^0 e^+ e^-$ at LAMPF II is presented. An experimental sensitivity to a branching ratio as small as $10^{-11}$ appears possible.

3686 (LA—9798-P, pp 277-280) **CP-violating polarization in K/sub $\mu 3/^+$ and K/sub $\mu 3/^0$ decays.** McFarlane, W.K. (Temple Univ., Philadelphia, PA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Polarization of the muon in K/sub $\mu 3/$ decay that is transverse to a suitably defined decay plane would violate time-reversal invariance and hence CP invariance. Existing experiments limit the magnitude of the T-violating polarization to less than about $6 \times 10^{-3}$. The possibility of using LAMPF II to improve this limit is discussed.

3687 (LA—9798-P, pp 281-283) **Consideration of a measurement of $(eta_{00})^2/(eta/sub\ +-/)^2$.** Cronin, J.W. (Univ. of Chicago, IL). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The possibility of measuring $(eta_{00})^2/(eta/sub +-/)^2$ with an accuracy of better than 0.5% at LAMPF II is explored. A possible design of an experiment is presented.

3688 (LA—9798-P, pp 284-285) **Experiment to measure $eta_{000}$.** Hoffman, C.M. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

An experiment to search for CP-violating $K^0 \rightarrow 3\pi^0$ decays at LAMPF II is discussed. A sensitivity to $(eta_{000})$ as large as $10^{-2}$ appears feasible.

3689 (LA—9798-P, pp 286-287) **Measurement of CP violation in Λ decay.** Kalogeropoulos, T. (Syracuse Univ., NY). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The possibility of searching for CP violation by comparing Λ and anti Λ decays is discussed. With an anti p beam that has been proposed for LAMPF II, differences in decay rates as low as $10^{-4}$ can be explored.

3690 (LA—9798-P, pp 288-289) **CP symmetry in a high magnetic field.** Maki, A. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The experiment described would investigate whether CP in the $K^0$ system persists in a high magnetic field. If CP violation is a manifestation of a broken symmetry in a gauge theory, CP symmetry could be restored above a certain critical magnetic field.

3691 (LA—9798-P, pp 290-301) **Kaon decays.** Goldman, T. (Los Alamos National Lab., NM); Herczeg, P.; Mischke, R.E.; Lubatti, H.J. (comps.). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The decays of the charged and neutral kaons have played an extremely important role in our understanding of the fundamental interactions. The observation of $2\pi$ and $3\pi$ decay modes of the charged kaons led to the discovery of parity nonconservation in the weak interactions. The breakdown of CP symmetry was found in the $2\pi$ decays of the K/sub L/. More recently, the suppression of decays such as K/sub L/ $\rightarrow \mu^+\mu^-$ led to the prediction of the charmed quark. [Subsequently, the order of magnitude of the charmed quark mass was successfully predicted from the observed K/sub L/ - K/sub S/ mass difference (Δm/sub K/).] Studies of the decay modes of the K mesons continue to be of great interest. As we discuss here, their study can provide information of fundamental importance and may even lead to discoveries with far-reaching consequences. We primarily address rare (small branching ratio) kaon decays, the study of which will benefit most from the increase in intensity provided by LAMPF II. These include: (1) lepton-family violating kaon decays (for example, K/sub L/ $\rightarrow \mu e$); (2) lepton-family conserving allowed decays that are severely suppressed in the standard model (for example, K/sub L/ $\rightarrow \mu^+\mu^-$); and (3) allowed but suppressed decays for which the observables measured in the final state do not fully identify the decay mode. These decays may involve new, conjectured particles. (For example, $K^+ \rightarrow \pi^+$nu anti nu appears experimentally as $K^+ \rightarrow \pi^+ +$ nothing seen, where the latter may be objects other than neutrinos. 46 references. (WHK)

3692 (LA—9798-P, pp 302-303) **Experiment to measure the kaon beta decay rate.** Highland, V.L. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

With the intense K/sub L/$^0$ beams available at LAMPF II, a measurement of the rate K/sub L/$^0 \rightarrow K^{+-}e^{-+}$nu is feasible. A possible experiment is described.

3693 (LA—9798-P, pp 304-308) **Search for exotics in two-body decay of $K^+$: K/sub $\mu_2$/ and K/sub $\pi_2$/ revisited.** Yamazaki, T. (Univ. of Tokyo, Japan). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

New light is shed on K/sub $\mu_2$/ and K/sub $\pi_2$/ decays of $K^+$ in view of the possible existence of heavy neutrinos and Higgs particles, which could be revealed in high-resolution spectroscopy in a wide momentum range. A recent experiment at KEK is described and future perspectives are given.

3694 (LA—9798-P, pp 309-311) **Searching for $K^+ \rightarrow \pi^+\mu^+e^-$.** Chaloupka, V.; Lubatti, H.J.; Rothberg, J.E.; Young, K.K. (Univ. of Washington, Seattle). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

An experiment to search for $K^+ \rightarrow \pi^+\mu^+e^-$ at LAMPF II is described. It is based on an approved BNL experiment but would be sensitive to the $10^{-12}$ level.

3695 (LA—9798-P, pp 312-315) **Considerations on a detector system for LAMPF II sensitive to K$^0$/sub L/ $\rightarrow \mu e$ at the $10^{-12}$ level.** Chaloupka, V. (Univ. of Washington, Seattle); Lubatti, H.J.; Rothberg, J.E.; Young, K.K.; Hoffman, C.M. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

An experiment is described that could search for the lepton-flavor violating decay for K$^0$/sub L/ $\rightarrow \mu e$ with a sensitivity $<10^{-12}$ at LAMPF II. The apparatus could also search for muon polarization in K$^0$/sub L/ $\rightarrow \mu^+\mu^-$ and for the rare decay K$^0$/sub L/ $\rightarrow e^+e^-$.

3696 (LA—9798-P, pp 316-318) **Experiment to study the decay $K^+ \rightarrow \pi^+$ nu anti nu.** Louis, W.C. (Princeton Univ., NJ). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A possible LAMPF II experiment is presented that would measure the decay $K^+ \rightarrow \pi^+$ nu anti nu to the $10^{-12}$ level. In addition the experiment would be sensitive to other rare decay modes such as $K^+ \rightarrow \pi^+X$, $K^+ \rightarrow \pi^+\gamma\gamma$, $K^+ \rightarrow \pi^+\mu^+\mu^-$, $K^+ \rightarrow \pi^+\mu e$, and $K^+ \rightarrow \mu^+$ nu nu anti nu. In the context of the present standard theory with three generations, the branching ratio is estimated to be in the range $10^{-10}$ to $3 \times 10^{-9}$.

3697 (LA—9798-P, pp 319-329) **Hyperon decays.** Goldman, T. (Los Alamos National Lab., NM); Hynes, M.V.; Mischke, R.E.; Oka, T.; Sanford, T.W.L. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Just as LAMPF has permitted new levels of precision in investigations involving pions and muons, LAMPF II will facilitate such progress above the threshold for production of particles with strangeness. While the strange mesons may receive most attention from particle physicists, the strange baryons also provide essential input to the search for a complete description of subatomic physics. To keep the discussion of hyperon decays together, some topics in strong-interaction physics are included in addition to those relevant to electroweak physics. 39 references.

3698 (LA—9798-P, pp 330-332) **Measurement of the decay asymmetry in $\Sigma^+ \rightarrow p\gamma$.** Zeller, M.E. (Yale Univ., New Haven, CT). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

With the anticipated low-momentum $K^-$ fluxes at LAMPF II, one can investigate the spin dependence of the decay $\Sigma^+ \rightarrow p\gamma$.

In Physics with LAMPF II.

The feasibility of measuring the muon capture rate from the triplet hyperfine level in muonic hydrogen is discussed. An experiment using a tunable, pulsed laser to pump some population from the singlet to the triplet state is evaluated.

3712 (LA-UR—83-3096) **No-neutrino double beta decay: more than one neutrino.** Rosen, S.P. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 8p. (CONF-8309163—2). NTIS, PC A02/MF A01. Order Number DE84001748.

From Conference on low energy tests of conservation laws in particle physics; Blacksburg, VA, USA (12 Sep 1983).

Interference effects between light and heavy Majorana neutrinos in the amplitude for no-neutrino double beta decay are discussed. The effects include an upper bound on the heavy neutrino mass, and an A dependence for the effective mass extracted from double beta decay. Thus the search for the no-neutrino decay mode should be pursued in several nuclei, and particularly in $Ca^{48}$, where the effective mass may be quite large.

3713 (SLAC—262) **Quark flavor identification in electron-positron annihilation.** Kaye, H.S. (Stanford Linear Accelerator Center, CA (USA)). Sep 1983. Contract AC03-76SF00515. 64p. NTIS, PC A04/MF A01. Order Number DE84002349.

Thesis.

The theoretical issues relevant to inclusive muon analysis, the MAC detector and its data flow structure, the identification of muons in hadronic events and the measurement of their momenta, and the selection of events so as to minimize background are described. Experimental results are presented describing the fragmentation of heavy quarks into hadrons, the semimuonic branching fractions of the heavy quarks, the asymmetry in the angular distribution of the heavy quarks, and the invariant mass and charged multiplicity of heavy quark jets. In addition, lower limits are set on the masses of certain proposed particles that are expected to decay semileptonically. Finally, events containing two muons are analyzed in order to investigate the possibility of mixing in the B-B system and whether the b might form its own SU(2) singlet.

3714 (SLAC-PUB—3129) **Radiative corrections to $e^+e^-$ reactions to all orders in α using the renormalization group.** Tsai, Y.S. (Stanford Linear Accelerator Center, CA (USA)). 1983. Contract AC03-76SF00515. 27p. (CONF-830631—2). NTIS, PC A03/MF A01. Order Number DE84002034.

From 6. biennial wind energy conference; Minneapolis, MN, USA (1 Jun 1983).

Renormalization group technique is used to improve the accuracy of the lowest order radiative corrections in QED. The exponentiation of infrared terms comes automatically. It also leads to exponentiation of the vertex functions. It predicts the existence of conversion of photons into pairs and the result agrees with the Kroll-Wada relation. Kinoshita-Lee-Nauenberg cancellation of mass singularities occurs to all order in $\alpha$ in leading log approximation in the final state if we sum over all the final states. Higher order corrections to the order $\alpha^3$ asymmetry is shown to be small. The results are used to derive useful formulas for the radiative corrections to processes such as $e^+e^- \rightarrow \mu^+\mu^-$, $e^+e^- \rightarrow \mu^+\mu^-\gamma$, $e^+e^- \rightarrow$ hadron continuum, $e^+e^- \rightarrow$ very narrow resonance such as phi, and $e^+e^- \rightarrow$ not very narrow resonance such as $Z^0$.

3715 **(SLAC-PUB—3202) First results from MARK III at SPEAR. MARK III collaboration.** Einsweiler, K.F. (Stanford Linear Accelerator Center, CA (USA); Stanford Univ., CA (USA)). Sep 1983. Contract AC03-76SF00515. 3p. (CONF-830718—12). NTIS, PC A02/MF A01. Order Number DE84002020.

From International Europhysics conference on high energy physics; Brighton, UK (20 Jul 1983).

The MARK III detector, operating at SPEAR, has collected $\sim 2.7 \times 10^6$ phi decays and 4500 $nb^{-1}$ of phi" decays. Preliminary results from the full phi samples are presented.

3716 **Measurement of the lifetime of bottom hadrons.** Lockyer, N.S.; Jaros, J.A.; Nelson, M.E.; Abrams, G.S.; Amidei, D.; Baden, A.R.; Blocker, C.A.; Boyarski, A.M.; Breidenbach, M.; Burchat, P. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305; Lawrence Berkeley Laboratory and Department of Physics, University of California, Berkeley, California 94720; and Department of Physics, Harvard University, Cambridge, Massachusetts 02138). *Physical Review Letters;* **51**: No. 15, 1316-1319(10 Oct 1983). Contract AC03-76SF00515;W-7405-ENG-48;AC03-76SF00098.

The average lifetime of bottom hadrons was measured with the Mark II vertex detector at the storage ring PEP. The lifetime was determined by measuring the impact parameters of leptons produced in bottom decays. tau/sub b/ = (12.0/sub -3.6//sup +4.5/ +- 3. 0) x $10^{-13}$ sec was found.

3717 **New measurement of deep-inelastic e-p asymmetries.** Baum, G.; Bergstroem, M.R.; Bolton, P.R.; Clendenin, J.E.; DeBotton, N.R.; Dhawan, S.K.; Guo, Y.; Harsh, V.; Hughes, V.W.; Kondo, K. (Institute of High Energy Physics, Beijing, China; University of Bern, CH-3012 Bern, Switzerland; University of Bielefeld, D-4800 Bielefeld, Federal Republic of Germany; National Laboratory for High Energy Physics, KEK, Tsukuba, Japan; Kyoto University, Kyoto, Japan; Centre d'Etudes Nucleaires, Saclay). *Physical Review Letters;* **51**: No. 13, 1135-1138(26 Sep 1983). Contract AC03-76SF00515.

Spin-dependent asymmetries have been measured in inclusive deep-inelastic scattering of longitudinally polarized electrons by longitudinally polarized protons. Data were obtained at a scattering angle of $10^0$ and for incident energies of 16.2 and 22.7 GeV, which cover the kinematic range $0.18<x<0.70$ and $3.5<Q^2<10.0$ $(GeV/c)^2$. The present results provide a test of scaling and of the Bjorken and Ellis-Jaffe sum rules and are compared with various models of proton spin structure.

3718 **Production of charmed mesons in $e^+e^-$ annihilation at 10.5 GeV.** Avery, P.; Bebek, C.; Berkelman, K.; Cassel, D.G.; DeWire, J.W.; Erlich, R.; Ferguson, T.; Galik, R.; Gilchriese, M.G.D.; Gittleman, B. (Cornell University, Ithaca, New York 14853). *Physical Review Letters;* **51**: No. 13, 1139-1142(26 Sep 1983).

A measurement is presented of the inclusive production of charged D( and neutral D mesons from nonresonant $e^+e^-$ annihilation in the energy region near the Y(4S) resonance. The momentum distribution shows a large contribution at high momenta as expected for heavy quark production. Comparison of the spectrum with several phenomenological models is made. The relative yields of the D( and D mesons indicate that the charm cross section is dominated by the D( contribution.

3719 **Observation of baryons in B-meson decay.** Alam, M.S.; Csorna, S.E.; Garren, L.; Mestayer, M.D.; Panvini, R.S.; Yi, X.; Giles, R.; Hassard, J.; Hempstead, M.; Kinoshita, K. (Vanderbilt University, Nashville, Tennessee 37235). *Physical Review Letters;* **51**: No. 13, 1143-1146(26 Sep 1983).

In a sample of B mesons from the decay of the Y(4S) produced in $e^+e^-$ collisions at the Cornell Electron Storage Ring, inclusive protons, antiprotons, lambdas and antilambdas have been observed. Lower limits to the B-to-baryon branching ratios are derived.

3720 **Inclusive D and D/sup/ production in $e^+e^-$ annihilation at 29 GeV.** Ahlen, S.; Akerlof, C.; Baranko, G.; Baringer, P.; Beltrami, I.; Bender, D.; Blockus, D.; Brabson, B.; Chapman, J.; Cho, Y. (Argonne National Laboratory, Argonne, Illinois 60439; Indiana University, Bloomington, Indiana 47405; Lawrence Berkeley Laboratory, Berkeley, California 94720; University of Michigan Ann Arbor, Michigan 48109; Purdue University, W. Lafayette, Indiana 47907; and Stanford Linear Accelerator Center, Stanford). *Physical Review Letters;* **51**: No. 13, 1147-1150(26 Sep 1983).

Inclusive production of ($D^0$,D-bar $^0$) and $D^{+-}$ mesons has been observed in $e^+e^-$ annihilation at 29 GeV. The signals correspond to R values of $R(D^0+D^0) = 3.25$ +- 1.2 and $R(D^+ + D^-) = 1.35$ +- 0.6. D/sup asteriskplus-or-minus/ production is also observed via the process D/sup asterisk+/$\rightarrow D^0\pi^+$ and its charge conjugate. The D and D( production rates are compared.

3721 **Precision measurement of the magnetic moment of the $\Sigma$p hyperon.** Hertzog, D.W.; Eckhause, M.; Giovanetti, K.L.; Kane, J.R.; Phillips, W.C.; Vulcan, W.F.; Welsh, R.E.; Whyley, R.J.; Winter, R.G.; Dodson, G.W. (College of William and Mary, Williamsburg, Virginia 23185). *Physical Review Letters;* **51**: No. 13, 1131-1134(26 Sep 1983).

The magnetic moment of the $\Sigma^-$ hyperon has been obtained from measurements of fine-structure splittings of x-ray transitions in $\Sigma^-$ exotic atoms. The use of targets consisting of sheets of Pb or W immersed in liquid hydrogen, and of a tagging technique utilizing the $\pi^+$ emitted in the reaction $K^-p \rightarrow \Sigma^-\pi^+$, resulted in improved x-ray signal-to-noise ratio by a factor of 15 over that in previous experiments. The present result is $\mu(\Sigma^-) = (-1.111$ +- 0.031 +- 0. 011)$\mu$/sub N/. .AE

3722 **Electron-positron annihilation cross section in SU(2)/sub L/xU(1) supergravity.** Dicus, D.A.; Nandi, S.; Repko, W.W.; Tata, X. (Center for Particle Theory, The University of Texas at Austin, Austin, Texas 78712). *Physical Review Letters;* **51**: No. 12, 1030-1033(19 Sep 1983).

For a wide range of masses of the W superpartners and the supersymmetric scalars it is shown that a measurement of the total electron-positron annihilation cross section is sufficient to demonstrate the existence or nonexistence of supersymmetry.

3723 **Lifetime of particles containing b quarks.** Fernandez, E.; Ford, W.T.; Read, A.L. Jr.; Smith, J.G.; De Sangro, R.; Marini, A.; Peruzzi, I.; Piccolo, M.; Ronga, F.; Blume, H.T. (Department of Physics, University of Colorado, Boulder, Colorado 80309). *Physical Review Letters;* **51**: No. 12, 1022-1025(19 Sep 1983). Contract AC02-81ER40025.

From a sample of hadronic events, produced in $e^+e^-$ collisions, semileptonic decays of heavy particles have been isolated and used to obtain a measurement for the bottom-quark lifetime of [1.8 +- 0.6(stat.) +- 0.4(syst.)] x $10^{-12}$ sec.

**3724 Precise measurement of the tau lifetime.** Jaros, J.A.; Amidei, D.; Trilling, G.H.; Abrams, G.S.; Blocker, C.A.; Boyarski, A.M.; Breidenbach, M.; Burke, D.L.; Dorfan, J.M.; Feldman, G.J. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305; Lawrence Berkeley Laboratory and Department of Physics, University of California, Berkeley, California 94720; and Department of Physics, Harvard University, Cambridge, Massachusetts 02138). *Physical Review Letters;* **51**: No. 11, 955-958(12 Sep 1983). Contract AC03-76SF00515;W-7405-ENG-48;AC03-76SF00098.

The tau lifetime was measured with the Mark II vertex detector at the storage ring PEP. tau/sub tau/ = (3.20 +- 0.41 +- 0.35) x $10^{-13}$ sec was found, which agrees well with e-$\mu$-tau universality.

**3725 Inclusive production of direct photons in 200-GeV/c collisions.** McLaughlin, M.; Biel, J.; Bromberg, C.; Brown, B.; Chandlee, C.; Cihangir, S.; Cooper, S.R.W.; Ferbel, T.; Garelick, D.; Glass, G. (Fermilab, Batavia, Illinois 60510; Michigan State University, East Lansing, Michigan 48824; University of Minnesota, Minneapolis, Minnesota 55455; Northeastern University, Boston, Massachusetts 02115; and University of Rochester, Rochester, New York 14627). *Physical Review Letters;* **51**: No. 11, 971-974(12 Sep 1983).

The authors have measured the inclusive production of direct photons in the transverse momentum (p/sub T/) range 2.1—5.0 GeV/c in 200-GeV/c collisions of protons and $\pi^+$ mesons on a carbon target. A significant yield of direct photons was observed for p/sub T/>2.5 GeV/c. The invariant cross section for direct-photon production, when compared with measurements from the CERN intersecting storage rings, can be expressed in terms of p/sub T/ and x/sub T/ = 2p/sub T/root-bars as (42 +- 14)(1-x/sub T/)/sup 8.1plus-or-minus1.0/p /sub T//sup -6.6plus-or-minus0.3/ $\mu$b/GeV$^2$ for the c.m. energy range from $\sqrt{s}$ = 19.4 to 63 GeV, and for the x/sub T/ range from 0.2 to 0.5.

**3726 Measurement of psi(3097) and psi'(3686) decays into selected hadronic modes.** Franklin, M.E.B.; Feldman, G.J.; Abrams, G.S.; Alam, M.S.; Blocker, C.A.; Blondel, A.; Boyarski, A.M.; Breidenbach, M.; Burke, D.L.; Carithers, W.C. . (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305 and Lawrence Berkeley Laboratory and Department of Physics, University of California, Berkeley, California 94720). *Physical Review Letters;* **51**: No. 11, 963-966(12 Sep 1983). Contract AC03-76SF00515;W-7405-ENG-48.

Measurements of psi(3097) and psi'(3686) branching fractions for selected hadronic decays are presented. The ratio of psi' to psi branching fractions for these decays is consistent with the ratio of branching fractions to lepton pairs, with the exception of the decays to rho$\pi$ and K(K for which this ratio is substantially smaller.

**3727 Existence of Ξ resonances above 2 GeV.** Jenkins, C.M.; Albright, J.R.; Diamond, R.N.; Fenker, H.; Goldman, J.H.; Hagopian, S.; Hagopian, V.; Morris, W.; Kirsch, L.; Poster, R. (Florida State University, Tallahassee, Florida 32306). *Physical Review Letters;* **51**: No. 11, 951-954(12 Sep 1983).

Ξ/sup asterisk-/ production was studied in the reaction $K^- + p \rightarrow$ K/sub slow/$^+ + X^-$ at 5 GeV/c. The slow $K^+$ was electronically detected, while the $X^-$ was observed as a missing mass, thus allowing for observation of all Ξ( independent of decay mode. The observed Ξ states were Ξ(1320), Ξ(1530), Ξ(1820), Ξ(2030), Ξ(2250), Ξ(2370), and Ξ(2500). These data establish and confirm the existence of Ξ((2250) and indicate a peculiar production-cross-section behavior for the Ξ((2370).

**3728 Study of the decay J/psi→γetaππ.** Edwards, C.; Partridge, R.; Peck, C.; Porter, F.C.; Antreasyan, D.; Gu, Y.F.; Kollman, W.; Richardson, M.; Strauch, K.; Weinstein, A. . (Physics Department, California Institute of Technology, Pasadena, California 91125). *Physical Review Letters;* **51**: No. 10, 859-862(5 Sep 1983). Contract AC03-76SF00515;AC02-76ER03064;AC03-81ER40050;AC02-76ER03072.

The radiative decay J/psi→γνππ has been studied with data taken with the crystal ball detector at the SPEAR $e^+e^-$ storage ring. In addition to the well-known eta', the etaππ mass spectrum shows a broad enhancement centered at ~1700 MeV. The authors have searched for the iota(1440) in the etaππ mass spectrum and find R(J/psi→γiota)(iota→etaππ)/R(J/psi→γiota)(iota→KKπ)<0.5 (90% confidence level).

**3729 Precise measurement of the Σi magnetic moment.** Ankenbrandt, C.; Berge, J.P.; Brenner, A.E.; Butler, J.; Doroba, K.; Elias, J.E.; Lach, J.; Laurikainen, P.; MacLachlan, J.; Marriner, J. (Fermi National Accelerator Laboratory, Batavia, Illinois 60510). *Physical Review Letters;* **51**: No. 10, 863-866(5 Sep 1983). Contract AC02-76CH03000;AC02-76ER03075.

The $\Sigma^+$ magnetic moment is measured to be (2.38 +- 0.02)$\mu$/sub N/ with use of 44 457 polarized $\Sigma^+ \rightarrow p\pi^0$ decays in a charged hyperon beam. The inclusively produced $\Sigma^+$ in this 210 GeV/c beam have a polarization of about 0.20 for production angles between 2.5 and 7.0 mrad.

**3730 Search for fractional charges in water.** Joyce, D.C.; Abrams, P.C.; Bland, R.W.; Johnson, R.T.; Lindgren, M.A.; Savage, M.H.; Scholz, M.H.; Young, A.B.A.; Hodges, C.L. (Physics and Astronomy Department, San Franciso State University, San Francisco, California 94132). *Physical Review Letters;* **51**: No. 9, 731-734(29 Aug 1983). Contract AC03-81ER40009.

Results are presented from a search for fractional charges in water from a variety of natural sources. About 30 000 water drops have been measured, comprising 51 μg of water and dissolved materials. No evidence for fractional charge was seen.

**3731 Measurement of the ν/sub μ/ charged-current cross section.** Baker, N.J.; Connolly, P.L.; Kahn, S.A.; Murtagh, M.J.; Tanaka, M.; Baltay, C.; Bregman, M.; Caroumbalis, D.; Chen, L.D.; French, H. (Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **51**: No. 9, 735-738(29 Aug 1983).

The Fermilab 15-ft bubble chamber, filled with a heavy neon-hydrogen mix, was exposed to a narrow-band ν/sub μ/ beam. Based on the observation of 830 charged-current ν/sub μ/ interactions, the cross section was found consistent with a linear rise with the neutrino energy in the interval 10 GeV< or =E/sub ν/< or ≈240 GeV. The average slope was determined to be σ/sub ν//E/sub ν/ = (0.62 +- 0.05) x $10^{-38}$ cm$^2$ GeV$^{-1}$.

**3732 nu-bar/sub μ/-nucleon charged-current total cross section for 5—250 GeV.** Taylor, G.N.; Cence, R.J.; Harris, F.A.; Jones, M.d; Parker, S.I.; Peters, M.W.; Peterson, V.Z.; Stenger, V.J.; Ballagh, H.C.; Bingham, H.H. (Department of Physics and Astronomy, University of Hawaii, Honolulu, Hawaii 96822). *Physical Review Letters;* **51**: No. 9, 739-742(29 Aug 1983).

The nu-bar/sub μ/ charged-current total cross section has been measured with the Fermilab 15-ft bubble chamber plus the external muon identifier and internal "picket fence." Beam monitoring information used for the flux calculation was obtained from Blair et al., whose detector operated in the same dichromatic beam. The present result, aver p- aged over nu-bar/sub μ/ energies from 5 to 250 GeV, is σ/E = (0.340 +- 0.019 +- 0.022) x $10^{-38}$ cm$^2$/(GeV nucleon) for an isoscalar target.

3733 **Prompt muon-neutrino production in a 400-GeV proton beam-dump experiment.** Ball, R.C.; Coffin, C.T.; Gustafson, H.R.; Jones, L.W.; Longo, M.J.; Roberts, T.J.; Roe, B.P.; Wang, E.; Castoldi, C.; Conforto, G. (University of Michigan, Ann Arbor, Michigan 48109). *Physical Review Letters;* **51**: No. 9, 743-746(29 Aug 1983).

The prompt $\nu$/sub $\mu$/ and nu-bar/sub $\mu$/ flux produced by 400-GeV protons has been measured with a detector located 56 m from a tungsten target. The cross section for the hadronic production of charm is determined to be 27 +- 4 +- 5 $\mu$b/nucleon subject to the following assumptions: DD-bar production only; $A^1$ variation of cross section; and a parametrization of the D-production cross section which is $(1-x)^4 \exp(-2m/\text{sub perpendicular/})$. The ratio of prompt nu-bar/sub $\mu$/ flux to prompt $\nu$/sub $\mu$/ is measured to be 1.12 +- 0.24 +- 0.17, consistent with predominantly DD-bar production.

3734 **Energy variation of the analyzing power in the reaction p/sub pol/$+p \rightarrow d+\pi^+$.** Saha, A.; Seth, K.K.; Kielczewska, D.; Iversen, S.; Kaletka, M.; Barlow, D.; Smith, A.D. (Northwestern University, Evanston, Illinois 60201). *Physical Review Letters;* **51**: No. 9, 759-762(29 Aug 1983).

Precision measurements of the analyzing powers for the reaction p/sub pol/$+p \rightarrow d+\pi^+$ have been made at ≈550, 600, 650, 700, and 800 MeV. The data have been analyzed in terms of Legendre polynomials. It is found that excitation functions for both even and odd Legendre coefficients exhibit very similar resonant behaviors. It is concluded that the triplet amplitudes are as strongly dominated by the $\Delta(1232)$ as the well-known singlet amplitude, $^1D_2$, and that the data do not exhibit any anomalous behavior suggestive of dibaryon resonances.

3735 **Search for right-handed currents in muon decay.** Carr, J.; Gidal, G.; Gobbi, B.; Jodidio, A.; Oram, C.J.; Shinsky, K.A.; Steiner, H.M.; Stoker, D.P.; Strovink, M.; Tripp, R.D. (Lawrence Berkeley Laboratory and Department of Physics, University of California, Berkeley, California 94720). *Physical Review Letters;* **51**: No. 8, 627-630(22 Aug 1983). Contract AC03-76SF00098.

New limits are reported on right-handed currents, based on precise measurement of the $e^+$ spectrum end point in $\mu^+$ decay. Highly polarized muons from the TRIUMF "surface" beam were stopped in metal foils within a 1.1-T spin-holding longitudinal field or a 70-G spin-precessing transverse field. For the spin-held data, the V-A decay rate vanishes in the beam direction at the end point. Measurement of this rate sets the 90%-confidence limits $\xi$P/sub $\mu$/ $\delta$/rho>0.9959 and M(W/sub R/)>380 GeV, where W/sub R/ is the possible right-handed gauge boson.

3736 **Evidence for the F meson at 1970 MeV.** Chen, A.; Goldberg, M.; Horwitz, N.; Jawahery, A.; Lipari, P.; Moneti, G.C.; Trahern, C.G.; Van Hecke, H.; Alam, M.S.; Csorna, S.E. (Syracuse University, Syracuse, New York 13210). *Physical Review Letters;* **51**: No. 8, 634-637(22 Aug 1983).

Evidence is presented for a narrow meson resonance of mass 1970 +- 5 +- 5 MeV produced in continuum $e^+e^-$ annihilations at $\sqrt{s}$ of 10.5 GeV, and decaying into a phi and a charged $\pi$.

3737 **(CEA-CONF—6648) Prospects in the study of very inelastic electronuclear reactions.** Laget, J.M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Mar 1983. 24p. (CONF-830394—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700064.

From 7. biennial meeting of nuclear physics; Aussois, France (14 Mar 1983).

Nuclear physics has reached a frontier where it is not possible to consider the classical constituents (mesons and nucleons) as inert objects: it is necessary to take also into account internal structure. After having shown how the study of nuclei, with the electromagnetic probe, has made it possible to solve and clarify some problems, it is shown under what conditions these internal degrees of freedom can show up in the study of electronuclear reactions, and to what extent the study of complex hadronic systems at short distance is an essential complement to the study of high momentum scattering between elementary hadrons.

3738 **(CEA-N—2324) Experimental study of like-sign dimuons and of trimuons events produced in high energy neutrino and antineutrino interactions.** Peyaud, B. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France); Paris-7 Univ., 75 (France)). Feb 1983. 166p. (In French). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84700053.

The analysis of like-sign dimuons (587 $\mu^-\mu^-$ events induced by neutrinos and 115 $\mu^+\mu^+$ induced by antineutrinos) requires a detailed calculation of the non prompt background from a charged-current event in which a $\pi \rightarrow \mu\nu$ or $K \rightarrow \mu\nu$ decay occurs. We have calculated this background by the Monte Carlo method and we show evidence for the existence of a prompt signal which is respectively $(4.1+-1.5)10^{-5}$ and $(5.9+-1.7)10^{-5}$ relative to the charged current and for a muon momentum cut of 6.5 GeV/c. We also show that in the kinematical distributions of the $\mu^-\mu^-$ events there is evidence that $\pi$ or $K \rightarrow \mu\nu$ cannot account for all events and we conclude that there must be a prompt signal. This prompt signal is explained only qualitatively by associated charm production which however fail to account for the magnitude. The interpretation of the trimuon events (165 events from the neutrino beam and 33 events from the antineutrino beam) is done in terms of two "classical" components. The first component is a radiative part (internal bremsstrahlung) and the second component is due to muon pair production at the hadron vertex. These trimuon events are used to set some limits on heavy lepton production and bottom quark production in neutrino interaction.

3739 (CERN—83-02-Vol.2, pp 392-395) **Polarization as a tool for studying the physics of weak interactions.** Soffer, J. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

Realistic possibilities exist now to obtain high-energy polarized proton beams with high luminosity and to measure the polarization of a stored beam. This will be our motivation to discuss parity violating weak effects in inclusive hadron and jet production with polarized beams. There are also interesting predictions for helicity asymmetries in Wsup(+-) and Z production in pp and panti p collisions.

3740 **(DOE/ER/03992—0527) Triple Reggeon interactions and Reggeon dynamics in high-energy collisions.** Chiu, C.B. (Texas Univ., Austin (USA). Center for Particle Theory). Aug 1983. Contract AS05-76ER03992. 21p. (CONF-830689—10). NTIS, PC A02/MF A01. Order Number DE84002843.

From 14. international symposium on multiparticle dynamics; Lake Tahoe, NV, USA (22 Jun 1983).

We show that in the triple-Regge region, there are ample data confirming the dominance of the RRP interactions. Also we recall that the triple-Pomeron features are present in the diffractive data. This success of Regge phenomenology suggests that the notion of Reggeon dynamics is still very useful. In this context we review two promising approaches, the extended eikonal models and the critical Pomeron solution in the Reggeon field theory for the Pomeron.

3741 **(DOE/ER/40048—22-N3) Dynamics of the soliton bag.** Wilets, L.; Goldflam, R. (Washington Univ., Seattle (USA). Inst. for Nuclear Theory). Sep 1983. Contract AC06-81ER40048. 7p. (CONF-8306136—2). NTIS, PC A02/MF A01. Order Number DE84001542.

From International symposium on quarks and nuclear structure; Bad Honnef, F.R. Germany (13 Jun 1983).

Portions are illegible in microfiche products.

The MIT bag was one of the earliest and most successful models of QCD, imposing confinement and including perturbative gluon interactions. An evolution of the MIT bag came with the introduction of the chiral and cloudy bags, which treat pions as elementary particles. As a model of QCD, the soliton model proposed by Friedberg and Lee is particularly attractive. It is based on a covariant field theory and is sufficiently general so that, for certain limiting cases of the adjustable parameters, it can describe either the MIT or SLAC (string) bags. The confinement mechanism appears as a dynamic field. This allows non-static processes, such as bag oscillations and bag collisions, to be calculated utilizing the well-developed techniques of nuclear many-body theory. The utilization of the model for calculating dynamical processes is discussed. 14 references. (WHK)

3742 **(EFI—494(37)-81) Inclusive spectra of hadrons in photon-nucleus collisions.** Gevorkyan, S.R.; Zhamkochyan, V.M. (Erevanskij Fizicheskij Inst. (USSR)). 1982. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704005.

Inclusive hadron productin in the $\gamma A \rightarrow hX$ photon-nucleus interaction is investigated. It is shown that, as in the case of the photoabsorption total cross sections, in the inclusive spectra of hadrons with the rise of photon energy the hadron component of the photon begins to dominate. This leads to the charge in the A-dependence of inclusive spectra which does not contradict the available experimental data.

3743 **(EFI—530(17)-82) Renormalizability of reggeon field theory with account of thresholds and mass terms at D = 2.** Eremyan, Sh.S.; Nazaryan, A.E. (Erevanskij Fizicheskij Inst. (USSR)). 1982. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703970.

It is shown that the account of the reggeon production thresholds $x_{i_0}=\ln(M^2/S_0)$ approximately 2 in the Reggeon field theory results in the fact that the epsilon-expansion becomes analytical at epsilon=2 and the simultaneous limiting transition to epsilon $\rightarrow$ 2 and E $\rightarrow$ 0 becomes possible which is consistent with the physical space dimension in the asymptotic energy region. The introduction of thresholds facilitates the accomplishment of perturbation theory calculations at D=2 eliminating the ultraviolet divergences of theory and proves useful for the accomplishment of smooth matching of the perturbation theory and asymptotic solutions.

3744 **(EFI—533(20)-82) Reggeon field theory at D = 2 in two-loop approximation.** Eremyan, Sh.S.; Nazaryan, A.E. (Erevanskij Fizicheskij Inst. (USSR)). 1982. 45p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83703971.

A general method of constructing an explicit representation is developed for the pomeron propagator in the presence of additional parameters, such as the pomeron production threshold $x_{i_0}$, momentum transfer K vector or the intercept shift $delta_0$. The method is shown to be applicable in both one-loop and two-loop approximations. The obtained general formulae allow to consider the pomeron propagator in both asymptotic region and the region of the perturbation theory applicability. Besides, they provide the smooth matching of both these regions. The observed values are calculated, and the results connected with asymptotically high energies are discussed.

3745 **(IC—80/2) Instanton-anti-instanton interaction in the O(3) non-linear $\sigma$ model and an exactly soluble fermion theory.** Bukhvostov, A.P.; Lipatov, L.N. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1980. 38p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704009.

We calculate the potential energy of weak interacting instanton and anti-instanton quarks in the O(3) non-linear $\sigma$ model, which leads us to a two-component massive fermion theory. The exact solution for the ground state of the theory is built.

3746 **(IC—80/6) Deuteron D-wave and the non-eikonal effects in tensor asymmetries in elastic proton-deuteron scattering.** Alberi, G.; Bleszynski, M.; Santos, S.; Jaroszewicz, T. (International Centre for Theoretical Physics, Trieste (Italy)). Jan 1980. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704015.

It is shown that the tensor asymmetries in the elastic proton-deuteron scattering at medium energies are very sensitive to the non-eikonal corrections to the Glauber model. This sensitivity originates from the fact that, in double scattering, the non-eikonal corrections affect in a different way the contributions coming from the S- and D-wave parts of the deuteron wave function. This leads to considerable change of the tensor asymmetries not only in the region of the interference between single and double scatterings, but also in the region of dominance of the double scattering. It is suggested that these effects should be taken into account in any careful analysis of the proton-deuteron polarization data, which has as a goal the extraction of the NN amplitudes.

3747 **(IC—80/26) Critical analysis of the electromagnetic mass shift problem in QCD.** Craigie, N.S.; Narison, S.; Riazuddin. (International Centre for Theoretical Physics, Trieste (Italy)). Feb 1980. 27p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704010.

The paper analyzes the electromagnetic quark mass shift problem in the framework of QCD and concludes with a physically appealing sum rule for the proton neutron mass difference, in which the contribution from the divergent part of the photon loop has the right sign, after it has been renormalized. The paper reconciles the conflicting conclusions reached by respectively using the operator product expansion and the Dyson equations. In a recent discussion based on the latter special significance was given to the number of flavours $nsub(f) > 11$, for which by choosing the ordering of integration and summation naturally dictated by iteration of the Dyson equation, the electromagnetic mass shift comes out to be finite with the correct sign for msub(u) - msub(d). We show by using dimensional regularization and minimal subtraction for renormalization group improved Feynman graphs one obtains the same result independent of the number of flavours.

3748 **(IC—80/49) Are lepton and quark families quantized dynamical systems.** Krolikowski, W. (International Centre for Theoretical Physics, Trieste (Italy)). Apr 1980. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704011.

Lepton and quark families ($\nu$sub(N)), (esub(N))) and (usub(N)), (dsub(N) are conjectured to be quantum-dynamical systems in the space of generations N = 0,1,2,... Such a conjecture, called the "zeroth quantization", implies the form of lepton and quark mass spectra, if lepton and quark families are supposed to be almost in thermal equilibrium with the rest of the Universe. Toponium is predicted at about 38 GeV, while the next charged lepton at 28.5 GeV.

3749 **(IC—80/50) Role of interaction in neutrino statistics. In memory of Bronislaw Kuchowicz.** Deppert, W. (International Centre for Theoretical Physics, Trieste (Italy)). Apr 1980. 26p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704012.

The paper sets out to examine the role of interaction in neutrino statistics with the aid of the MATSUBARA method for calculation of thermodynamic potentials. For this purpose, a first step involves the use of the V-A interaction Hamilton operator. Estimations show that the relative effects of this interaction cannot exceed the very small value of $10^{-6}$. In a second step it is shown that even by using the Hamilton operator of the Weinberg-Salam theory this result does not change. This means that the neutrino statistics calculated by Kuchowicz do not need to be revised as a result of interaction effects. Discussions are made on the possibility of symmetry restoring at a critical temperature kTsub(c) approx.= 100 GeV. This idea is extended to the grand unification scheme and some speculative conclusions are drawn.

3750 **(IC—80/52) Problem of the deuteron smearing corrections - 1: the conventional approach.** Kusno, D.; Moravcsik, M.J. (International Centre for Theoretical Physics, Trieste (Italy)). May 1980. 59p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE83704013.

A comprehensive analysis to the problem of deuteron smearing corrections is given. Some problems of the usual approach (conventional approach) are discussed. It is shown that the formalism adopted by this approach leads to i) the existence of the so-called West $\beta$ corrections and ii) the disagreement of the sum rules with the quark parton model expectations in leptonic scattering. It is also shown that in this formalism the electroproduction expression is not inconsistent, and hence, in contradiction with Bodek's conclusion. Following West for the identification of the wave function, it is found that the smearing correction $\sigma$sub(s) of the high-energy (50-370 GeV) pion - and nucleon - process is non-negligible, and hence, in contradiction with the usual expectation. Another test for this approach is suggested.

3751 **(IC—80/86) Density of states, Poisson's formula of summation and Walfisz's formula.** Fucho, P. (International Centre for Theoretical Physics, Trieste (Italy)). Jun 1980. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704017.

Using Poisson's formula for summation, we obtain an expression for density of states of d-dimensional scalar Helmoholtz's equation under various boundary conditions. Likewise, we also obtain formulas of Walfisz's type. It becomes evident that the formulas obtained by Pathria et al. in connection with ideal bosons in a finite system are exactly the same as those obtained by utilizing the formulas for density of states.

3752 **(IC—80/88) Global quantity for dyons with various charge distributions.** Koh, I.G.; Kim, Y. (International Centre for Theoretical Physics, Trieste (Italy)). Jun 1980. 13p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704018.

The spatial volume integral of Tr *F F characterizes the dyons globally. This integral is investigated for the dyons with various electric and magnetic charge distributions, which can be probed by the scattering of the test particle in these dyon fields.

3753 **(IC—82/71) Mass and form factor effects in spectrum and width of the semileptonic decays of charmed mesons.** Fakirov, D.G. (International Centre for Theoretical Physics, Trieste (Italy)). Jun 1982. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704032.

Semileptonic decays of charmed mesons of F and D types with tau lepton production are considered using as an example the energetically possible decay of $D^-$ sub(S) meson in $\pi^0$ and $tau^-$. As the mass msub(tau) of tau lepton is big we consider the mass effects in the decay spectrum which are very closely connected to form factor effects in our approach.

3754 **(IC—82/91) New vacuum structure, background strength and confinement.** Wang, K.L. (International Centre for Theoretical Physics, Trieste (Italy)). Jul 1982. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704034.

In this paper we further extend the definition of the winding number. The Lagrangian of pure Y-M field system is written in the winding number space as the "kinetic" and "potential" energy parts, the "potential" energy part corresponds to a periodic potential. Therefore, by analogy to the results of solid state physics, the lowest energy state of the system is shown to have the energy band structure. This new vacuum state is shown to satisfy general requirements. Using the band theory of the vacuum, we can give the bag model a clear interpretation and verify the existence of the background strength of the vacuum. The parameter B of the bag model and the background strength of the vacuum can be related to each other in this vacuum theory. The result made by comparison is satisfactory.

3755 **(IC—82/145) Hadronic couplings of open beauty states.** Ram, S.N.; Singh, C.P. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1982. 13p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704026.

Strong interaction coupling parameters of particles with beauty quantum number are obtained using dispersion sum rules in various forms, e.g. current algebra sum rules, superconvergence sum rules and finite energy sum rules etc. These sum rules lead to a set of algebraic relations among masses and coupling constants. We compare the hadronic couplings of beautiful particles as obtained from various techniques and discuss their implications on the hadronic production of these states.

3756 **(IC—82/223) Note in the msub(quark) dependence of <q-barq> from chiral perturbation theory.** Christos, G.A. (International Centre for Theoretical Physics, Trieste (Italy)). Nov 1982. 6p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704031.

Using known results from chiral perturbation theory and simple chiral Ward identities we obtain the estimates <s-bars>approx.=1.48<u-baru> and <d-bard>-<u-baru>/<u-baru>approx.=1.46x10$^{-2}$. The heavy quark expansion result is used to give an overall view of the msub(quark) dependence of <q-barq>.

3757 **(IFVE-OTF—82-22) Eigenvalue problem in the QCD simulating theory.** Arbuzov, V.A.; Kurennoy, S.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704038.

A simplified model of the interaction between "quarks" and "gluons" with the infrared asymptotics of the gluon propagator is considered. The requirement of a consistent description of "gluon" and "quark" propagators and a vertex function is shown to lead, in the particular covariant gauge, to an eigenvalue problem for the "magnetic moment" and the mass of the "quark". This eigenvalue problem has a unique solution in the model. The considered simplified theory can be interpreted as a model which describes qualitatively the situation in the infrared region for QSD.

3758 **(IFVE-OTF—82-38) Energy dependence of spin-spin correlation parameters in large-angle pp scattering.** Troshin, S.M.; Tyurin, N.E. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704040.

Three-dimensional dynamic equation in QFT for the scattering amplitude is used to analyse large-angle pp-scattering with account for all of its spin components. The expressions for spin-spin correlation parameters Asub(nn)($\pi$/2) and Asub(ll)($\pi$/2) have been obtained. They reveal oscillations with s exchange (where s is total energy square of system). Such a behaviour allows one to understand the experimental data, obtained at ZGS energies. The asymptotic values of the parameters Asub(nn)($\pi$/2) and Asub(ll)($\pi$/2) appear to be 1/3 and -1/3 respectively.

3759 **(IFVE-OTF—82-106) Some new results in classical theory of relativistic string.** Pron'ko, G.P.; Razumov, A.V.; Soloviev, L.D. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 16p. (CONF-820718—47). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703976.

From 21. international conference on high energy physics; Paris, France (29 Jul 1982).

A complete set of gauge invariant quantities has been constructed. The collective coordinate method is used which for the first time made it possible to construct all gauge invariant quantities. An analogous result has been obtained for the Ramond and Neveu-Schwarz spin strings. General properties of the classical string world surface have been investigated. It is shown that this surface may be singular and in three-dimensional space-time it must

be singular. It is shown that the singularities of the string world surface are tightly connected with singular solutions to of the Liouville equation.

3760 **(IFVE-OTF—82-112) Hadronic heavy flavour production from the 2 → 3 QCD subprocess.** Dubinin, M.N.; Slavnov, D.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704036.

The role of the 2 → 3 QCD subprocess qg → Q anti Qq (where Q - heavy quark) is considered in the reactions of hadronic charmed particle production. The total cross section of charmed quark production in pp collisions and c anti c inclusive spectrum from the 2 → 3 subprocess gq → c anti cq are presented. At the energies E > 200 GeV the third order contribution is larger than the contribution from 2 → 2 subprocesses. The heavy quark spectrum calculated in the third order decreases with the growth of Feynman variable x essentially slower than the second order spectrum.

3761 **(INIS-BR—81) Hadron phenomenology.** Santoro, A.F.S. (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). [nd]. 45p. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704386.

Some important aspects in hadron phenomenology such as glueballs, the existence of diquarks, quark fusion and the flavor model are discussed.

3762 **(INIS-BR—85) Hadron spectroscopy.** Zagury, N. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Fisica). Nov 1981. 65p. (In Portuguese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83704387.

The main successes of the quark model and its application in the description of the hadrons mass spectra and of some of its static properties are reviewed.

3763 (INIS-SU—180, pp 112-115) **Gauge invariant Delbourgo approximation and gluon propagator.** Khelashvili, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

The Delbourgo spectral representation is considered that linearizes the Dyson-Schwinger equation for the gluon propagator. The Delbourgo representation, when performing computations in the light-like calibration $n^2=0$, is shown to lead to the equation linearization without auxiliary suppositions. The spectral density (SD) equation is obtained which describes, in the approximation of basic logarithms, the SD behaviour both in the UV- and IR regions. The equation, as given in Delbourgo's work, presents different behaviours of SD in the regions indicated. The author states that the hope for a possible improvement of the result based on consideration of the terms set aside in Delbourgo's work is unjusted. It is necessary to more fully utilize the information contained in the Slavnov-Taylor identities.

3764 (INIS-SU—180, pp 5-14) **CP invariance problem in the quantum chromodynamics.** Krasnikov, N.V.; Matveev, V.A.; Tavkhelidze, A.N. 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

The CP-invariance problem in QCD is reviewed. Non-Abelian gauge fields are the basis for constructing modern models of both electroweak and strong interactions. A quasiclassical analysis of non-Abelian theories points out to the possibility of occurrence in these theories of the ground state degeneration related with the so-called topological charge. The presence of degeneration gives evidence of a complicated structure of the vacuum state in gauge theories, that structure leading to serious physical consequencies. In particular, the so-called theta-structure of the vacuum in QCD discussed of late years may lead to the P- and CP-invariance violation in strong interactions.

3765 (INIS-SU—180, pp 35-42) **Tau lepton in 1980.** Azimov, Ya.I.; Khoze, V.A. (AN SSSR, Leningrad. Inst. Yadernoj Fiziki). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

A brief description is given of new data on studies of the tau-lepton and perspectives on its further investigations. The general properties of the $tau^{+-}$ lepton and $\nu sub(tau)$: mass, spin, theoretical lifetime are discussed as well as the structures of electromagnetic and weak vertices. The present relative probabilities (experimental and theoretical are tabulated for the decays $tau^- \rightarrow esup(-)anti\ \nu sub(e)\nu sub(tau)$, $tau^- \rightarrow \mu sup(-)anti\ \nu sub(\mu)\nu sub(tau)$, $tau^- \rightarrow \pi sup(-)\nu sub(tau)$, $tau^- \rightarrow ksup(-)\nu sub(tau)$, $tau^- \rightarrow rhosup(-)\nu sub(tau)$, $tau^- \rightarrow K^*sup(-)\nu sub(tau)$, $tau^- \rightarrow Asub(1)sup(-)\nu sub(tau)$, $tau^- \rightarrow \pi sup(-)\pi sup(-)\pi sup(+)\nu sub(tau)$, $tau^- \rightarrow \pi sup(-)rhosup(0)\nu sub(tau)$, $tau^- \rightarrow \nu sub(tau) + (>3$ charged particles$) + (>= o\pi^0)$. Probability constraints of $tau^+$ exotic decays are presented. The experimental data reflecting the nature of the $tau^{+-}$ lepton and $\nu sub(tau)$ and that of $tau^{+-}$ lepton decay are considered. The search for a neutral $N_0$ lepton and a heavier charged tau' lepton is underway. However, since the tau-lepton has not yet been studied experimentally completely, many of the properties discussed, such as the tau and $\nu sub(tau)$ lifetimes and masses, probabilities of ordinary and exotic decays, need additional experimental confirmation.

3766 (INIS-SU—180, pp 42-47) **Large angle scattering for nonlocal quasi-potentials.** Kvinikhidze, A.N.; Khvedelidze, A.M. (AN Gruzinskoj SSR, Tbilisskij Matematicheskij Inst.). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

To proceed the investigation into hadron elastic scattering, a class of nonlocal quasipotentials is considered that satisfies the suggested asymptotic condition and meets the requirement of convergence of integrals corresponding to any iteration of the quasipotential equation. A solution of the quasipotential equation is obtained for the amplitude of elastic scattering of particles with any spin in the range of high energies and fixed angles. A simple way is given for the determination of several first terms of expansion in power series $\sqrt{S}$ over the mass surface ($\sqrt{S}=\sqrt{p^2}$ vector$+m_1^2+\sqrt{p^2}$ vector$+m_2^2$, where p vector is the vector-momentum, $m_1$ and $m_2$ are masses of colliding particles). It is noticed that the representation obtained for the scattering amplitude may prove to be useful for the analysis of asymptotic topological quark diagrams.

3767 (INIS-SU—180, pp 116-121) **Large-angle hadron scattering at high energies.** Goloskokov, S.V.; Kudinov, A.V.; Kuleshov, S.P. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

Based on the quasipotential Logunov-Tavkhelidze approach, corrections to the amplitude of high-energy large-angle meson-nucleon scattering are estimated. The estimates are compared with the available experimental data on pp- and $\pi^{+-}$p-scattering, so as to check the adequacy of the suggested scheme to account for the preasymptotic defects. The compared results are presented in the form of tables and graphs. The following conclusions are drawn: 1. the account for corrections, due to the long-range interaction, to the amplitude gives a good agreement between the theoretical and experimental data. 2. in the case of $\pi^{+-}$p- scattering the corrections prove to be comparable with the main asymptotic term up to the values of transferred pulses psub(lambdac)=50 GeV/c, which results in a noticeable deviation from the quark counting rules at such energies. Nevertheless, the preasymptotic formulae do well, beginning with psub(lambdac) approximately 6 GeV/c. In case of pp-scattering the corrections are mutually compensated to a considerable degree, and the deviation from the quark counting rules is negligible.

3768 **(IPNO-TH—82-27) Spin dependence in N anti N at low energy.** Richard, J.M. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1982. 4p. (CONF-8205103—0-Summ.). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704041.

From Workshop on physics at LEAR with low energy cooled antiprotons; Erice, Italy (9 May 1982).
Published in summary form only.

3769 **(IPNO-TH—83-02) Ground state baryons in the non-relativistic quark model.** Richard, J.M.; Taxil, P. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1982. 36p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700040.

We analyse the properties of the ground state baryons in the non-relativistic quark model. The three-body problem is solved by means of the hyperspherical expansion. We consider various two-body potentials of power law type and also a three-body linear potential. In displaying the results, we insist on quantities like ratios of splittings which are scale independent and are functions only of the power of the potential and of the ratio of quark masses.

3770 **(JINR—R-2-82-562) Constant of the baryon-meson strong interaction.** Dinejkhan, M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700042.

The coupling constants Gsub(NN$\pi$)sup(2)/4$\pi$, Gsub($\Sigma\Sigma\pi$)sup(2)/4$\pi$, Gsub($\Lambda$NK)sup(2)/4$\pi$ etc. are calculated within the framework of the virton-quark model. The obtained results are in satisfactory agreement with the experimental data.

3771 **(JINR—R-2-82-563) Relativistic wave functions of a nucleon as a quark-diquark bound state.** Linkevich, A.D.; Savrin, V.I.; Sanadze, V.V.; Skachkov, N.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700043.

Aproximate analytic solutions are obtained for the covariant three-dimensional equations for the wave function of a fermion, composed of two particles with spins 0 and 1/2 or 1 and 1/2, with an one-gluon exchange potential. The solutions will be used to calculate structural functions and other characteristics of a nucleon as a quark-di-quark bound state.

3772 **(JINR—R-2-82-832) Vector meson spin alignment in the fusion madel.** Efremov, A.V.; Teryaev, O.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700044.

The quark fusion is applied to describe the polarization characteristics of inclusive vector mesons. Satisfactory agreement with experimental data is achieved. The following is underlined: there are no reasons for "degeneration" of alignment with the growth of the energy or momentum transfer. The alignment gives exceptionally valuable information on the meson production mechanism.

3773 **(JINR—R-4-82-564) Primitives (eigenstates) of six-quark bags with an external pion field.** Efimov, V.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1982. 3p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700045.

The $^1S_0$ channels of NN-interaction in the framework of the boundary condition model with the energy dependent logarithmic derivative is considered. It is supposed that the logarithmic derivative has the form which follows from the quark bag model, and that exists the external OPE-potential. The proposed model describes the $^1S_0$-phase of NN-scattering for the 0-515 MeV energy (lab. syst.) with chi$^2$ per point approximately 1.05. It permits to get corresponding six-quark primitives (eigenstates) for various values of radii of quark bag with external pion field.

3774 **(LA—9587-MS) Production of pions, kaons, and muons by 16-GeV protons.** Scheidker, E.J.; Thiessen, H.A. (Los Alamos National Lab., NM (USA)). Sep 1983. Contract W-7405-ENG-36. 51p. NTIS, PC A04/MF A01. Order Number DE84002320.

Cross sections for a variety of particles produced from a 16-GeV proton beam collision with target protons are calculated directly for specified momenta and angles. These results are compared with Monte Carlo calculations for particle production cross-sections: the Sanford-Wang cross-section formula and the Sanford-Wang cross-section fomula plus kinematic reflection. Some of these particles decay near the target, forming cloud daughter particles. Monte Carlo distributions of cloud pions from the decay K/sub short/$^0 \rightarrow \pi^+\pi^-$ and cloud muons from $\pi^+ \rightarrow \mu^+$nu are calculated. The trajectories of random rays of cloud particles, which result from a decay within and pass through a specified beam pipe, are traced back to the target plane and plotted. The beam pipe is 1 m long and 20 cm in diameter. There is an elliptical aperture that is 20 cm horizontally and 2 cm vertically. Cloud particles are constrained in angle, less than 100 mrad with respect to the horizontal axis and less than 10 mrad with respect to the vertical axis.

3775 **(LA—9798-P, pp 333-338) Electromagnetic decays of hyperon-excited states.** Hynes, M.V. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Electromagnetic decays have served as bench marks in the developing stages of the shell model in nuclei. The quark confinement pictures for baryons are now in a similar developing stage. This experiment will test in an unambiguous way, the configurations present in the low-lying excited states of the $\Lambda$, $\Sigma$, and XI by measuring the electromagnetic branching ratios that connect them. About half the decays should be measured at Fermilab using the hyperon beam via the Primakoff effect. The remaining transitions, including the very interesting forbidden ones, will require the kaon fluxes and purities available at LAMPF II.

3776 **(LA-UR—83-3067) Collective, stochastic and nonequilibrium behavior of highly excited hadronic matter.** Carruthers, P. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 24p. (CONF-8309168—1). NTIS, PC A02/MF A01. Order Number DE84001726.

From 3. international conference on ultra-relativistic nucleus-nucleus collisions; Upton, NY, USA (26 Sep 1983).

We discuss selected problems concerning the dynamic and stochasticc behavior of highly excited matter, particularly the QCD plasma. For the latter we consider the equation of state, kinetics, quasiparticles, flow properties and possible chaos and turbulence. The promise of phase space distribution functions for covariant transport and kinetic theory is stressed. The possibility and implications of a stochastic bag are spelled out. A simplified space-time model of hadronic collisions is pursued, with applications to A-A collisions and other matters. The domain wall between hadronic and plasma phase is of potential importance: its thickness and relation to surface tension are noticed. Finally we reviewed the recently developed stochastic cell model of multiparticle distributions and KNO scaling. This topic leads to the notion that fractal dimensions are involved in a rather general dynamical context. We speculate that various scaling phenomena are independent of the full dynamical structure, depending only on a general stochastic framework having to do with simple maps and strange attractors. 42 references.

3777 **(SLAC-PUB—3136) Problems at the interface between perturbative and nonperturbative quantum chromodynamics.** Brodsky, S.J.; Bodwin, G.T.; Lepage, G.P. (Stanford Linear Accelerator Center, CA (USA); Argonne National Lab., IL (USA); Cornell Univ., Ithaca, NY (USA). Lab. of Nuclear Studies). Jun 1983. Contract AC03-76SF00515. 27p. (CONF-830368—3). NTIS, PC A03/MF A01. Order Number DE84002375.

From Non-perturbative quantum chromodynamics conference; Stillwater, OK, USA (7 Mar 1983).

Predictions based on perturbative QCD rest on three premises: (1) that hadronic interactions become weak in strength at small invariant separation; (2) that the perturbative expansion in $\alpha$/sub s/(Q) is well-defined; and (3) factorization: all effects of collinear singularities, confinement, nonperturbative interactions, and bound state dynamics can be isolated at large momentum transfer in terms of structure functions, fragmentation functions, or in the case of exclusive processes, distribution amplitudes. The assumption that the perturbative expansion for hard scattering amplitudes converges has certainly not been demonstrated; in addition, there are serious ambiguities concerning the choice of renormalization scheme and scale choice $Q^2$ for the expansion in $\alpha$/sub s/($Q^2$). We will discuss a new

procedure to at least partly rectify the latter problem. In the case of exclusive processes, the factorization of hadronic amplitudes at large momentum transfer in the form of distribution amplitudes convoluted with hard scattering quark-gluon subprocess amplitudes can be demonstrated systematically to all orders in $\alpha$/sub s/($Q^2$). In the case of inclusive reactions, factorization remains an ansatz; general all-orders proofs do not exist because of the complications of soft initial state interactions for hadron-induced processes; thus far factorization has only been verified to two loops beyond lowest order in a regime where the applicability of perturbation theory is in doubt. However, we shall show that a necessary condition for the validity of factorization in inclusive reactions is that the momentum transfer must be large compared to the (rest frame) length of the target. We review the present status of the factorization ansatz. 52 references.

3778 **(SLAC-PUB—3219) Factorization and other novel effects in QCD.** Brodsky, S.J. (Stanford Linear Accelerator Center, CA (USA)). Sep 1983. Contract AC03-76SF00515. 18p. (CONF-8308131—1). NTIS, PC A02/MF A01. Order Number DE84002082.

From 3. international conference on physics in collision; Como, Italy (31 Aug 1983).

Recent progress in proving the validity of factorization for inclusive reactions in QCD is reviewed. A new necessary condition involving the target length is emphasized. We also discuss a number of novel effects in gauge theory including null zone phenomena, color transparency, formation zone conditions, and possible heavy quark Fock states components in ordinary hadrons. 36 references.

3779 **(SLAC-PUB—3249) Quantum chromodynamics in few-nucleon systems.** Brodsky, S.J. (Stanford Linear Accelerator Center, CA (USA); Stanford Univ., CA (USA)). Oct 1983. Contract AC03-76SF00515. 22p. (CONF-830862—10). NTIS, PC A02/MF A01. Order Number DE84002677.

From 10. international conference on few-body problems in physics; Karlsruhe, F.R. Germany (21 Aug 1983).

One of the most important implications of quantum chromodynamics (QCD) is that nuclear systems and forces can be described at a fundamental level. The theory provides natural explanations for the basic features of hadronic physics: the meson and baryon spectra, quark statistics, the structure of the weak and electromagnetic currents of hadrons, the scale-invariance of hadronic interactions at short distances, and evidently, color (i.e., quark and gluon) confinement at large distances. Many different and diverse tests have confirmed the basic predictions of QCD; however, since tests of quark and gluon interactions must be done within the confines of hadrons there have been few truly quantitative checks. Nevertheless, it appears likely that QCD is the fundamental theory of hadronic and nuclear interactions in the same sense that QED gives a precise description of electrodynamic interctions. Topics discussed include exclusive processes in QCD, the deuteron in QCD, reduced nuclear amplitudes, and limitations of traditional nuclear physics. 32 references. (WHK)

3780 **(WIS-PH—82/55) Comparative study of the NN$\pi$ system, II. Elastic NN scattering.** Rinat, A.S.; Bhalerao, R.S. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Nov 1982. 37p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700046.

Using a theory which is unitary in the two and three particle sector, we calculate real and imaginary parts of I = 0, 1 elastic NN phase parameters, and various pp total cross sections. Comparisons are made with results of similar and alternative approaches. Some aspects of the dibaryon issue are discussed.

3781 **(WIS-PH—83/4) Glueballs multiquark states and the OZI rules.** Lipkin, H.J. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Jan 1983. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700051.

New signatures for detection of non-quarkonium mesons are considered, including $K^+K^+\pi^+\pi^-$ and Ksub(s)Ksub(s)$\pi^+\pi^+$ decays for states where $K^+K^+$ and $K^+$Ksup(*)$^+$ decays are forbidden, and A-dependence of Ssup(*) and delta production on nuclei by kaon beams. Analysis of OZI rule shows that only selection rules forbidding hairpin diagrams are valid and that phi phi production by pion beams is not a serious OZI violation indicating presence of glueballs.

3782 **(WIS-PH—83/9) Collective vs atomic models of the hadrons.** Stokar, S. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Feb 1983. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700052.

We examine the relationship between heavy and light quark systems. Using a Bogoliubov-Valatin transformation we show how to interpolate continuously between heavy quark atomic models and light quark collective models of the hadrons.

3783 **(WIS-PH—83/26) Magnetic moments of baryons.** Lipkin, H.J. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Jun 1983. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700049.

The new experimental values of hyperon magnetic moments are compared with sum rules predicted from general quark models. Three difficulties are encountered which are not easily explained by simple models. The isovector contributions of nonstrange quarks to hyperon moments are smaller than the corresponding contribution to nucleon moments, indicating either appreciable configuration mixing present in hyperon wave functions and absent in nucleons or an additional isovector contribution beyond that of valence quarks; e.g. from a pion cloud. The large magnitude of the $>^-$ moment may indicate that the strange quark contribution to the $>$ moments is considerably larger than the value $\mu(\Lambda)$ predicted by simple models which have otherwise been very successful. The set of controversial values from different experiments of the $\Sigma^-$ moment include a value very close to $-(1/2)\mu(\Sigma^+)$ which would indicate that strange quarks do not contribute at all to the $\Sigma$ moments.

3784 **Detailed calculation of the complete two-loop Higgs-Yukawa beta function in an arbitrary $\alpha$ gauge.** Fischler, M.; Oliensis, J. (Department of Physics, University of Pittsburgh, Pittsburgh, Pennsylvania 15260). *Physical Review [Section] D: Particles and Fields;* **28**: No. 8, 2027-2036(15 Oct 1983).

We present a complete calculation of the two-loop contributions to the Higgs-Yukawa beta function, giving the evaluations of individual Feynman diagrams. We calculate in an arbitrary $\alpha$ gauge, and in a range of subtraction schemes that includes minimal subtraction (MS) and modified minimal subtraction (MS). We compute the beta function explicitly for the Weinberg-Salam theory, but our results should be readily adaptable to the computation of the beta function in other theories.

3785 **Extension of the soft-photon theorem for bremsstrahlung.** Bohannon, G.E.; Heller, L. (Carnegie Software, Redondo Beach, California 90278). *Physical Review Letters;* **51**: No. 13, 1151-1154(26 Sep 1983).

A correction to the soft-photon theorem for bremsstrahlung is derived for problems in which the strong interaction is known at large distances. In studies of a model problem the correction generally results in significant improvement in accuracy over the original theorem.

3786 **Time delay and the dyon charge.** Grossman, B. (The Rockefeller University, New York, New York 10021). *Physical Review Letters;* **51**: No. 11, 959-962(12 Sep 1983). Contract AC02-81ER40033.

The scattering of fermions from a magnetic monopole is analyzed in a theory with CP nonconservation. The dyon charge that arises can be understood as a Friedel sum rule from the theory of alloys, as the data for a Riemann-Hilbert problem in the theory of integral equations, and as a consequence of specifying Wigner's R matrix at the monopole core.

3787 **Limits to the number of neutrinos: A comment on the $Z^0$ discovery.** Halzen, F.; Mursula, K. (University of Helsinki, Research Institute for Theoretical Physics, SF-00170 Helsinki 17, Finland). *Physical Review Letters;* **51**: No. 10, 857-858(5 Sep 1983). Contract AC02-76ER00881.

The observation of four Z's in a sample of events containing 32 charged W 's improves terrestrial bounds on the number of neutrinos by roughly one order of magnitude. Also a bound on the production cross section of Z's relative to W 's is obtained. These bounds do not depend on the determination of the Z width.

3788 **Quark mixing matrix in a composite model.** Katsumata, H.; Tomozawa, Y. (Randall Laboratory of Physics, University of Michigan, Ann Arbor, Michigan 48109). *Annals of Physics (New York);* **149**: No. 2, 273-285(Sep 1983).

The generalized mixing matrix of quarks is computed based on a composite model of quarks and leptons. Among potentials between constituent particles examined V(r) = Ar/sup s/ (As>0) and A in r (A>0), it is shown that potentials with exponent 0< or ≈s< or ≈3 or ln r are consistent with current experimental data for the mixing matrix elements.

3789 **Topological soliton bag model for baryons.** Rho, M.; Goldhaber, A.S.; Brown, G.E. (Institute for Theoretical Physics, State University of New York, Stony Brook, New York, 11794). *Physical Review Letters;* **51**: No. 9, 747-750(29 Aug 1983). Contract AC02-76ER13001.

Furnishing Skyrme's chiral soliton with a quark-bag core appears to generate a qualitative advance in the phenomenology of nucleon structure.

3790 **Catalysis of flavor nonconservation by monopoles.** Nair, V.P. (Physics Department, Syracuse University, Syracuse, New York 13210). *Physical Review Letters;* **51**: No. 8, 631-633(22 Aug 1983). Contract AC02-76ER03533.

A simple argument based on current algebra is given to show how monopoles can lead to baryon decay and other flavor-changing processes.

3791 **Family gauge symmetry from a composite model.** Zhou, B.R. (Fermi National Accelerator Lab., Batavia, IL (USA)); Chang, C.H. (New York Univ., NY (USA). Dept. of Physics; Princeton Univ., NJ (USA). Inst. for Advanced Study). *Physics Letters,* [*Section*] *B;* **127**: No. 3/4, 209-214(28 Jul 1983).

A family gauge symmetry SUsup(F)(2) could emerge from a composite model of quarks and leptons under some assumptions of chiral hyperflavor symmetry-breaking pattern. Possible dynamical mechanisms which break the family and electroweak gauge group and produce quark-lepton masses are indicated and their phenomenologies are discussed qualitatively.

3792 **Correlations and fluctuations in hadronic multiplicity distributions: The meaning of KNO scaling.** Carruthers, P.; Shih, C.C. (Los Alamos National Lab., NM (USA). Theoretical Div.). *Physics Letters,* [*Section*] *B;* **127**: No. 3/4, 242-250(28 Jul 1983).

Charged hadronic multiplicity distributions at Fermilab, ISR and collider energies are shown to be described by generalized Bose-Einstein distributions of the type encountered in quantum optics. Systematic energy-dependent deviations from KNO scaling are well described by simple cases of this formula, which in the limit of large anti n have a simple and explicit scaling form, valid to a few percent at the CERN collider energy. It is suggested that this framework is generic, i.e., practically independent of dynamical details. The essential feature is that the field variables of the 'radiant surface' for hadronic emission are distributed as gaussian random variables (with k effective sources) as suggested by a typical central limit theorem argument. In order to bring the lower energy data into a form easily comparable with higher energy data, particularly for the crucial large multiplicity events (n/anti n) >> 1, it is essential to remove the two charges of the 'leading' particles from the counting rules. The long tail of the KNO distribution is to be identified with coherent fluctuations analogous to those occurring in the Hanbury-Brown-Twiss effect.

3793 **Hypernuclear spectroscopy in the p shell.** Auerbach, E.H.; Baltz, A.J.; Dover, C.B.; Gal, A.; Kahana, S.H.; Ludeking, L.; Millener, D.J. (Brookhaven National Laboratory, Upton, New York 11973). *Annals of Physics (New York);* **148**: No. 2, 381-435(Jul 1983). Contract AC02-76CH00016.

A comprehensive shell-model approach to Λ-hypernuclear spectroscopy in the p shell is developed. The available data on the spectra of $^{9}$/sub Λ/Be, $^{13}$/sub Λ/C, $^{13}$/sub Λ/C, $^{14}$/sub Λ/N, and $^{16}$/sub Λ/O are interpreted in this framework, leading to constraints on the residual ΛN interaction and the one-body Λ-nucleus potential. The mechanism for the formation of Λ hypernuclei via the $(K^-, \pi^-)$ reaction is treated in the relativistic distorted wave approximation, with careful attention paid to Fermi-averaging of the elementary $K^- n \rightarrow \pi^- \Lambda$ amplitude and recoil corrections. Departures from the simple weak coupling picture, arising from configuration mixing, are emphasized. This leads to approximate dynamical symmetries in hypernuclei which are forbidden in orbinary nuclei by the Pauli principle. Further experiments in the p shell are suggested which may reveal other aspects of ΛN interactions.

3794 **Quark mixing in weak interactions.** Chau, L.L. (Brookhaven National Lab., Upton, NY (USA). Physics Dept.). *Physics Reports: A Review Section of Physics Letters (Section C);* **95**: No. 1, 3-94(Apr 1983).

The status of the quark mixing in weak interaction is reviewed. The 3 x 3 quark mixing matrix for the three left-handed doublet model is analyzed using various experimental information involving strange, charmed, and b-flavored particles. Its interplay with nonleptonic decays, implication on neutral particle-antiparticle mixing and CP violation in heavy quark systems, and the possible origin of the quark mixing from quark mass matrix are discussed. Finally we briefly review the status of alternative sources for CP violation, and alternative models to the three left-hand quark doublet model.

3795 **(EFI—517(4)-82) Discrete symmetries in SO(N) grand unified groups and the survival hypothesis.** Asatryan, H.M. (Erevanskij Fizicheskij Inst. (USSR)). 1982. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703969.

The possibility of introducing the discrete symmetry D is studied which along with SUsup(c)(3)xSUsub(L)(2)xU(1) symmetry remains after the breaking of the SO(N) grand unified symmetry group by the Higgs fields vacuum with expectation values on of the order $10^{15}$ GeV. The quantum number corresponding to this symmetry distinguishes the fermions coupled with W-bosons via left and right currents. As a result the presence of low-mass fermions in the thoery is provided.

3796 **(IC—80/18) Neutral current weak interaction without electroweak unification.** Riazuddin. (International Centre for Theoretical Physics, Trieste (Italy)). Feb 1980. 13p. NTIS (US Sales Only), PC .A02/MF A01. Order Number DE83704008.

It is shown that it is possible to obtain the neutral current weak interaction as the third component of the SU(2) group without electroweak unification, provided that fundamental doublets contain in general a mixture of left-handed and right-handed fields. The main experimental consequence is the relation msub(W)sub(3)approx.=√2 msub(W), with the further possibility that msub(W) could be lower than that predicted by the standard model.

3797 **(IC—80/54) Eight-fold way to colour geometrodynamics.** Mielke, E.W. (International Centre for Theoretical Physics, Trieste (Italy)). May 1980. 38p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704014.

Colour models of strong interactions are generalized to a GL(8,C)sup(f) x GL(8,C)sup(c) gauge theory incorporating space-time curvature and Cartan's torsion. Following Salam, the dynamics is determined by an Einstein-Dirac-type Lagrangian. The resulting field equations are a nonlinear (due to the torsion) Heisenberg-Pauli-Weyl equation for the fundamental spinor fields and a generalized Einstein equation for the background metric of hadronic dimensions. According to this model, baryonic quarks are confined in geon (black soliton)-type objects by the tensor gluons of strong gravity. This approach also leads to a black soliton mass formula which is in qualitative agreement with part of the baryon spectrum. Hadronic mesons are interpreted as gluon strings trapped in a multiconnected spacetime. Interrelations of color geometrodynamics with other "bag" models are pointed out. Finally, the conceptual origin of this space-time foundation of quark confinement is presented.

3798 **(IC—80/72) Quark-lepton unification and proton decay.** Pati, J.C.; Salam, A. (International Centre for Theoretical Physics, Trieste (Italy)). May 1980. 38p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704016.

Complexions for proton decay arising within a maximal symmetry for quark-lepton unification, which leads to spontaneous rather than intrinsic violations of B, L and F are considered. Four major modes satisfying $\Delta B=-1$ and $\Delta F=0$, -2, -4 and -6 are noted. It is stressed that some of these modes can coexist in accord with allowed solutions for renormalization group equations for coupling constants for a class of unifying symmetries. None of these remarks is dependent on the nature of quark charges. It is noted that if quarks and leptons are made of constituent preons, the preon binding is likely to be magnetic.

3799 **(IC—80/94) Witten's charge formula.** Salam, A.; Strathdee, J. (International Centre for Theoretical Physics, Trieste (Italy)). Jul 1980. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704019.

Witten's formula for the dyon charge in the presence of a CP violating surface term is derived by a canonical argument.

3800 **(IC—80/116) Spin-spin asymmetries with $\nu$ and $\nu$-bar beams and polarized nucleons.** Socolovsky, M. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1980. 18p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704006.

We find that the predictions for spin-spin asymmetries in $\nu$ and $\nu$-bar-nucleon deep inelastic scattering of various models for spin distributions are very different. We argue that a measurement of these asymmetries would be a sensible test for the different models.

3801 **(IC—80/125) Generation of baryon excess in SU/sub L/$_2$ x SU/sub R/$_2$ x SU/sub c/$_4$.** Deo, B.B.; Prasad, V.B. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1980. 13p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704007.

We have calculated the magnitude of the cosmological baryon asymmetry in a gauge theory based on the group SUsub(L)(2) x SUsub(R)(2) x SUsub(c)(4) and find that plausible parameters exist in the model to explain the baryon excess with a subunifying mass scale of $10^4$-$10^5$ GeV. The novel idea used is that the vacuum eats away antimatter through the VEV of the Higgs meson.

3802 **(IC—81/154) Tests for complete breakdown of discrete symmetry in D neutral-anti D neutral.** Chela-Flores, J. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1981. 24p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704020.

Implications of the conservation of probability without assuming CPT invariance, but allowing for the existence of a direct superweak ($\Delta C=2$) interaction are studied for the charmed system D neutral-anti D neutral. We find that the values of the decay widths of the particles with definite mass lead to considerable simplifications in the phenomenological description of this neutral system. These simplifications do not occur in the K neutral-anti K neutral system. In particular, we obtain the expressions for the particle number per unit time, at time tau measured in the D neutral meson rest frame, arising from an initially pure beam of D neutral-mesons. By considering the anomalous part of the particle number expression, we find means of distinguishing between the various forms of discrete symmetry breakdown.

3803 **(IC—82/15) SO(14) unification of 3+1 families.** Karadayi, H.R. (International Centre for Theoretical Physics, Trieste (Italy)). Mar 1982. 41p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704027.

It is shown that the unification of 3+1 families is possible within the framework of 64 dimensional spinor representation of SO(14). Special care is given for a description without the heavy excess fermions such as conjugate and mirror or completely exotic fermions of some family unification schemes. With the aid of an intrinsic "L-R Asymmetry" mechanism which we proposed recently, the conventional strong and electromagnetic interactions are obtained for all four families by concentrating only on the symmetry breaking SO(14) → SU(3)sub(c) x U(1)sub(e.m.). However, the conventional weak interactions of the first three families are obtained just as in the standard SU(2)sub(L) x U(1)sub(Y) model, while those of the prescribed fourth family show certain differences. This is what we mean by 3+1 family unification. All vector particles mediating strong, electromagnetic and weak interactions which are the subjects of present phenomenological tests are specified among the vector fields of SO(14) and their mass mechanisms leading to a consistent description of this low-energy phenomenology are studied with the aid of the Higgs multiplets 14, 364, 1716 and 2002 of SO(14). Moreover, the fermion mass mechanisms are considered with the aid of these scalar multiplets and the contributions from these scalars to the vector and fermion masses are explicitly calculated. All these calculations are carried out in the new mathematical technique for the Lie algebra representations which we introduced recently.

3804 **(IC—82/89) Spontaneous breaking of global B-L symmetry and matter-antimatter oscillations in grand unified theories.** Mohapatra, R.N.; Senjanovic, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jul 1982. 27p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704033.

We explore the consequences of the hypothesis that B-L symmetry, which is exact in the standard model based on SU(2)sub(L) x U(1) x SU(3)sub(c) gauge group and its extension to the minimal SU(5) theory, is a spontaneously broken global symmetry. This results in possibly observable rates for $\Delta(B-L)=0$, $\Delta B=2$ hydrogen-antihydrogen transitions and double proton decay $pp\to e^+e^+$ ($\mu^+\mu^+$) and $\Delta(B-L)\text{not}=0$, $\Delta B=2$ neutron-antineutron mixing and $p+n\to\pi$'s, and furthermore, a relation between the transition time tausub(H-H-bar), tausub(n-n-bar), Majorana neutrino mass and a mass of a doubly charged Higgs particle $\Delta^{++}$ emerges. At the level of SU(2)sub(L) x U(1) x SU(3)sub(c), for tausub(n-n-bar)approx.$=10^7$ sec and msub($\Delta$)$^{++}$approx.$=20$ GeV, we predict tausub(H-H-bar)approx.$=10^3$ yr and tausub(pp)approx.$=10^{31}$ yr, both of which are experimentally stable numbers. The embedding of our model in SU(5) is discussed in detail, with the analysis of tausub(p) and sin$^2$thetasub(W) besides matter oscillations.

3805 **(IC—82/92) Anomaly extraction from the path integral.** Christos, G.A. (International Centre for Theoretical Physics, Trieste (Italy)). Jul 1982. 22p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704035.

Fujikawa's recently proposed derivation of the anomaly from the path integral is examined. It is attempted to give a better understanding of his work. In particular, evasions of his result are discussed; for example it is shown how chiral U(1) axial invariance can be maintained by employing a gauge variant regularization prescription. A brief connection with the point-splitting method is also made.

3806 **(IC—82/111) SU(N)-QCD$_2$ meson equation in next-to-leading order.** Durgut, M.; Pak, N.K. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1982. 34p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704022.

We compute the 1/N corrections to the meson equation in the regular cut-off scheme. We illustrate that although the quark and gluon self energy and vertex corrections do not vanish explicitly as in the singular cut-off scheme, their contributions to the meson Bethe-Salpeter equation get cancelled within the whole set of contributing diagrams. We also argue that 0(1/N) corrections to the meson equation remove the massless boson from the spectrum in accordance with the Coleman theorem.

3807 **(IC—82/117) Approach to gauge hierarchy in the minimal SU(5) model of grand unification.** Ghose, P. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1982. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704023.

It is shown that if all mass generation through spontaneous symmetry breaking is predominantly caused by scalar loops in the minimal SU(5) model of grand unification, it is possible to have an arbitrarily large gauge hierarchy msub(x) >> msub(w) with all Higgs bosons superheavy. No fine tuning is necessary in every order.

3808 **(IC—82/118) Scalar loops and the Higgs mass in the Salam-Weinberg-Glashow model.** Ghose, P. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1982. 6p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704024.

It is shown that spontaneous symmetry breaking is predominantly driven by scalar loops in the standard Salam-Weinberg-Glashow model if lambda approx.=0(e$^2$). The Higgs mass is predicted to be 0(64 GeV), which is considerably higher than the Coleman Weinberg prediction.

3809 **(IC—82/141) Quark mixing angles in the left-right symmetric model with light W/sub R/ from K$^0$-K$^0$ mixing.** Raychaudhuri, A. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1982. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704025.

K/sub L/-K/sub S/ mass difference and the CP violation parameter, epsilon, of the K$^0$-K$^0$ system are used to set bounds on the right-handed Cabibbo-like angle and the CP violating phase angle in the left-right symmetric electroweak model of four quarks. The corresponding mixing and phase angles in typical left-right asymmetric models (g/sub L/not=g/sub R/) are also determined.

3810 **(IC—82/157) Does nature like Nambu-Goldstone bosons.** Gelmini, G.B.; Nussinov, S.; Yanagida, T. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1982. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704029.

We argue here that many (up to around 30 species) so far undetected Goldstone bosons could exist in nature, for example, associated to the spontaneous breaking of a horizontal global symmetry, provided the breaking scale is V >or approx. 10$^{10}$ GeV. Since Goldstone bosons do not generate $r^{-1}$ but spin-dependent $r^{-3}$ nonrelativistic long-range potentials, the apparently most dramatic effect of massless bosons - new long-range forces competing with gravitation and electromagnetism - is easily avoidable (the Glashow-Weinberg-Salam breaking scale is enough). $\mu \to eG$ and $K \to \pi G$ provide the most restrictive bounds and probably the only possibility to look for Goldstone bosons in laboratory.

3811 **(IC—82/222) Order $\alpha$Gsub($\mu$) corrections to the parity-violating electron-quark potential in the Weinberg-Salam theory: parity-violations in one-electron atoms.** Lynn, B.W. (International Centre for Theoretical Physics, Trieste (Italy)). [nd]. 39p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704030.

Paper copy only, copy does not permit microfiche production0 refs.

We have calculated the order $\alpha$Gsub($\mu$) corrections to the order Gsub($\mu$) parity-violating (PV) electron-quark potential Hsub(PV)sup(e-q) at $q^2=0$ in the standard SU(2)sub(L) x U(1) theory using a renormalization scheme which has Msub(W), Msub(Z) and Msub(H) (Higgs' mass) as input parameters. We then use SU(3) relations to write an effective PV electron-nucleon potential Hsub(PV)sup(e-N) in terms of the dimensionless parameters Csub(1P), Csub(1N) (nuclear spin independent) Csub(2P), Csub(2N) (nuclear spin dependent) and Csub(3P), Csub(3N) (electron anomalous magnetic moment dependent). For ssub(theta)$^2$ identical to 1-Msub(W)$^2$/Msub(Z)$^2$ approx.= .23 and small Higgs' mass Msub(H)<or approx.Msub(W), the corrections to Csub(1P) are negligible while those to Csub(1N), Csub(2N) are quite large with corrections to Csub(2P) of medium importance. The Msub(H)-dependent corrections to these four parameters are all large for large Msub(H)>or approx.1 TeV. Csub(3P), and Csub(3N) are first induced at one loop and are small. We show that Csub(2P) and Csub(2N) suffer from large uncertainties due to the strong interactions which make the theoretical interpretation of experiments designed to measure these quantities less clear than was previously thought. The other parameters are relatively free from strong interaction uncertainties. We review the diseases of the old 1934 four-fermion theory and give an overview of the renormalization of the Weinberg-Salam theory. We discuss the possibility of high-precision experiments in one-electron atoms to measure these radiative corrections and remind the reader of a previously proposed experiment in hydrogen or deuterium which will measure Csub(1P) or Csub(1P)+Csub(1N) respectively.

3812 **(IFVE-OTF—82-37) One method to calculate of color factors of Feynman diagrams.** Khrushchev, V.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704039.

A method to calculate color factors associated with Feynman diagrams in SU(N) gauge theory is considered. The correspondence between the permutations isub(l),....., isub(n) of the indices l,..., n and diagrams from the set, which is the color basis for the fermion-fermion (qq) or fermion-antifermion (q anti q) interactions has been established. The formula for color factors of the diagrams, which correspond to the permutation isub(l),....., isub(n) is obtained. The color factors of some series of the vacuum q anti q-diagrams are calculated.

3813 **(IFVE-OTF—82-190) Properties of scalar constituents of hadrons with respect to SU(2)sub(L)xU(1) group.** Khrushchov, V.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704037.

A classification and possible mixing parameters for hadron scalar constituents qsub(i)sup(B), 1=1,..., 6 with the electric charge distribution Q+1, Q, Q, Q, Q, Q-1 have been found with respect to the group of electroweak interactions. It is suggested that direct neutral weak current is diagonal in the qsub(i)sup(B) flavour basis. Possible physical applications of the hadronic model, containing both spinor and scalar constituents are discussed.

3814 (INIS-mf—8157, pp 58-61) **Nondiagonal Z-decay - Z→anti e+$\mu$.** Mann, G. (Humboldt-Universitaet, Berlin (German Democratic Republic). Sektion Physik); Riemann, T. (Akademie der Wissenschaften der DDR, Berlin-Zeuthen. Inst. fuer Hochenergiephysik). 1982. NTIS (US Sales Only), PC A15/MF A01. (CONF-820675—Vol.2).

From International conference on neutrino physics; Balaton, Hungary (14 Jun 1982).

The decay of the Z boson postulated by Weinberg-Salam theory of electromagnetic and weak interactions is calculated using the nondiagonal Kobayashi-Maskawa neutrino mass matrix. The branching ratio of the decay of Z boson into positron and muon is calculated in one-loop approximation assuming very small and mediate neutrino masses. The related problem of lepton number nonconservation is investigated.

3815 (INIS-SU—180, pp 26-35) **Nonlocal quark model.** Efimov, G.V.; Ivanov, M.A. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

A nonlocal quark model (NQM) is considered which describes the low-energy hadron physics and explains the problem of the quark and gluon confinement and the absence of colored hadron states. The model is based on a new quantized field - the virtonfield. The NQM implies the following: 1) hadrons are considered to follow the SU(3) group systematics, to have experimentally observed masses, and to be described by standard quantized fields; 12) quarks in the SU(3)xSUsub(c)(3) group are described by quantized quark-virton fields; 3) hadrons are supposed to be capable of interacting with each other not directly, but by the way of quark exchange; 4) hadrons are supposed to be the bound states of quarks; 5) the integrals corresponding to any Feynman diagrams are in good agreement; 6) weak and electromagnetic interactions of hadrons, quarks and leptons are introduced by Lagrangians invariant relative to the SU(3)xSUsub(c)(3)xU(1) group. In the framework of NQM a series of decay of pseudoscalar and vector mesons of the baryon octet and decuplet. All basic electromagnetic decays of eta-eta' mesons are calculated and the data are tabulated. The data characterizing the hadron structure are of greatest interest for the model. The authors are of opinion that NQM is quite capable of describing the low-energy hadron physics.

3816 (INIS-SU—180, pp 98-107) **T quark mass in the SO-(10) symmetry.** Asatryan, G.M.; Matinyan, S.G. (Erevanskij Fizicheskij Inst. (USSR)). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

The mass ratios for fermions are studied on the base of the unifying SO(10) group on the assumption that fermions obtain the mass at the expense of the Higgs average vacuum fields that are included in representations 10 and 126. The t-quark mass values are estimated to be msub(t) $<$ 22.6 GeV and msub(t) $<$ 29.3 GeV depending ion the QCD parameter $\Lambda$=0.08 GeV and $\Lambda$=0.34 GeV. A conclusion may be drawn that the t-quark mass in the SO(10) symmetry might exceed 15 GeV in difference with the earlier estimates. The neutrino mass at this may be equal to zero in the three-graph approximation.

3817 (INIS-SU—180, pp 107-112) **Practically stable proton in the SU-5 model.** Berezinskij, V.S.; Smirnov, A.Yu. 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

Permutations and mixing of the fermion right comonents from different generations, in the $SU_5$-model with an additional Higgs 45-let, could lead to substantial changes of both the proton lifetime and the relationships between the probabilities of proton decay different channels. In the presence of solely three known fermion generations the upper limit of the proton lifetime, tausub(p)sup(max) approximately equal to $10^{34}$ to $10^{37}$ years, is defined by the Kobayashi-Maskava angles and their experimental errors. At this the dominant channel is a difficulty detectable $p \rightarrow \nu X$ channel. The ultimate versions of mixing correspond to the longest proton lifetime and suppression of readily detectable decay modes. In view of principal difficulties of revealing the proton instability with tausub(p) $>$ or approximately $10^{34}$ years, the lifetimes for the ultimate versions imply a practically stable proton. By varying the mixing angles one could obtain an arbitrary proton lifetime between the prediction of both the standard $SU_5$ model and ultimate versions. All conclusions drawn to apply to the neutron decay with the baryonic number violation as well.

3818 (INIS-SU—180, pp 128-132) **P-odd nuclear forces are a source of parity violation in atom.** Flambaum, V.V.; Khriplovich, I.B. (AN SSSR, Novosibirsk. Inst. Yadernoj Fiziki). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

The effects of parity nonconservation in atoms are stated to be specified not only by neutral currents. They may also be induced by the P-odd nuclear forces. The spatial parity violation in a nucleus results in the appearance of spiral spin structure and toroidal currents. It is the resulting contribution to the nuclear vector-potential that leads to the P-odd interaction of an electron with a nucleus. A detailed consideration is given to the deuton anapole momentum. The experimental possibility is indicated to measure anapole momenta of various nuclei by way of studying the optical activity of gas of binary molecules.

3819 (LA—9798-P, pp 266-273) **CP violation.** Herczeg, P.; Hoffman, C.M. (comps.). (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The phenomenon of CP violation was discovered in 1964 when it was observed that the long-lived neutral kaon (K/sub L) decayed into two charged pions, a decay mode forbidden by CP symmetry. In the last 18 years, considerable time and effort have been expended to study and explain this phenomenon. The origin of CP violation is still unknown. However, the success of gauge theories has stimulated investigations that have led to better understanding of possible sources of CP violation in the fundamental interactions. The present experimental status is that CP violation has been observed only in the neutral kaon system and this violation is consistent with being due to a nonzero CP-violating imaginary off-diagonal term in the mass matrix that couples $K^0$ and anti $K^0$. A variety of theoretical models is consistent with this picture. To understand what interaction is responsible for CP violation is of crucial importance. As is discussed, the key to this understanding will be a series of high-precision experiments. LAMPF II is ideally suited to these experiments. 37 references.

(CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Dec 1982. 19p. (CONF-821253—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703967.

From Topical meeting on progress in the solution of quantum gauge theories; Trieste, Italy (17 Dec 1982).

We expose a method for dealing with Susskind fermions in lattice gauge theories. The Green's functions for composite mesons and baryons can be systematically computed as series expansions in the inverse dimension and inverse bare coupling constant. Spontaneous breaking of the remnant part of chiral symmetry is shown to occur. The corresponding $\pi$-like Goldstone boson is exhibited, and the low-lying meson and baryon masses evaluated. A semi-quantitative agreement with numerical estimates by Monte-Carlo simulations is found.

3825 **(CEA-CONF—6639) Complex singularities and distribution of zeros in Ising and gauge models.** Zuber, J.B. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)), Jan 1983. 15p. (CONF-821253—2). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703968.

From Topical meeting on progress in the solution of quantum gauge theories; Trieste, Italy (17 Dec 1982).

This talk reports on a study of properties of lattice gauge theories for complex values of the coupling, namely of possible singularities and distribution of zeros of their partition function.

3826 **(CEA-N—2329) Introduction to Feynman graph calculations.** Picard, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Mar 1983. 79p. (In French). NTIS (US Sales Only), PC A05/MF A01. Order Number DE84700039.

An introduction to Feynman graph calculations is presented through 6 examples treated in extenso at the first order of perturbation theory. It recalls the necessary formulas of quantum field theory, matrix element calculation and graph representation for the first developped S matrix terms. Next follow the detailed calculations for: 1) $\mu^-$ decay; 2) $e^-$,p scattering; 3) Compton scattering; 4) $\pi^+$ photoproduction on proton; 5) Bremsstrahlung; and 6) $\pi^0$ decay. Units and conventions, relativistic mechanics and relativistic kinematics of nuclear reactions are recalled in appendices.

Portions are illegible in microfiche products.

We review the unification of weak and electromagnetic interactions (QAD), the prevalent color gauge theory of the strong interactions (QCD) and attempts to embed both these theories in a further Unified Gauge Theory. We discuss the related advances in cosmology and touch upon other approaches to the understanding of particles and fields. 44 references.

3828 **(IC—80/123) New solution for the Schwinger model.** Baaquie, B.E. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1980. 31p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83703973.

We solve the Schwinger model exactly using the path integral. The fermion sector is solved using the axial current anomaly. We then study the Wilson loop integral for the interacting theory, and discuss the Wilson criterion for confinement.

3829 **(IC—82/93) Supergroup extensions: from central charges to quantization through relativistic wave equations.** Aldaya, V.; Azcarraga, J.A. de. (International Centre for Theoretical Physics, Trieste (Italy)). Jul 1982. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703975.

We give in this paper the finite group law of a family of supergroups including the U(1)-extended N=2 super-Poincare group. From this family of supergroups, and by means of a canonical procedure, we are able to derive the Klein-Gordon and Dirac equations for the fields contained in the superfield. In the process, the physical content of the central charge as the mass parameter and the role of covariant derivatives are shown to come out canonically from the group structure, and the U(1)-extended supersymmetry is seen as necessary for the geometric quantization of the relativistic elementary systems.

3830 **(IC—82/108) Necessity of intermediate mass scales in grand unified theories with spontaneously broken CP invariance.** Senjanovic, G. (International Centre for Theoretical Physics, Trieste (Italy)). Jul 1982. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704021.

It is demonstrated that the spontaneous breakdown of CP invariance in grand unified theories requires the presence of intermediate mass scales. The simplest realization is provided by weakly broken left-right symmetry in the context of SU(2)sub(L) x SU(2)sub(R) x U(1)sub(B-L) model embedded in grand unified theories.

3831 **(IC—82/153) Relation mr << 1 in the preon model.** Xinzhou, L.; Jianzu, Z.; Kelin, W. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1982. 12p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704028.

We use the result of the monopole in the SU(2) gauge theory, the isospin degrees of freedom converted into spin, to show a mechanism which can give the condition msub(q,l)rsub(q,l) << 1 in the composite model of quarks and leptons. In this paper, we have suggested a preon model with flavons fsub(i), chromons Csub($\alpha$) and somons ssub(k), in which the SUsub(H)(2) x Usub(A)(1) x Usub(B)(1) binding forces are broken spontaneously by a triplet of Higgs fields. The SUsub(M)(2) give a nonabelian monopole background field and Usub(A)(1) x Usub(B)(1) are interpreted as arising from hidden electric and magnetic type charges.

3832 **(IC—82/194) Surface terms and dual formulations of gauge theories.** Mecklenburg, W.; Mizrachi, L. (International Centre for Theoretical Physics, Trieste (Italy)). Sep 1982. 25p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703974.

Previously proposed duality transformations for a pure non-Abelian gauge theory are carried out for a Yang Mills theory with non-vanishing theta parameter. We argue that the theory is no longer self-dual even in the weak coupling limit, as there is a surface term generated by the duality transformation. This surface term has non-zero Pontryagin index hence it gets contributions from instanton type configurations only. However, it does vanish for monopoles and vortices, therefore, for this set of configurations, self-duality is maintained in the weak coupling region.

3833 **(IFT-P—06/81) Gauge hierarchy problem.** Natale, A.A.; Shellard, R.C. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1981. 16p. NTIS (US Sales Only), PC A06/MF A01. Order Number DE83704377.

The problem of gauge hierarchy in Grand Unified Theories using a toy model with O(N) symmetry is discussed. It is shown that there is no escape to the unnatural adjustment of coupling constants, made only after the computation of several orders in perturbation theory is performed. The propositions of some authors on ways to overcome the gauge hierarchy problem are commented.

3834 **(IFVE-OTF—82-169) Quantum theory of two-dimensional generalized Toda lattice on bounded spatial interval.** Leznov, A.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703979.

The quantization method of exactly solvable dynamical systems worked out in another paper is applied to a two-dimensional model described by the equations of generalized Toda lattice with a periodicity condition over spatial variable. The Heisenberg operators of the model are finite polynomials over the coupling constant $g^2$, whose coefficients functionally depend on operators of noninteracting fields. The model has a direct relation with the string theories and reduces formally when L→infinity to two-dimensional quantum field theory described by the equations of generalized Toda lattice the formal solution of which has been found in Refs.

3835 **(INIS-BR—84) Introduction to lattice gauge theories.** Alcaraz, F.C. (Sao Carlos Univ. (Brazil). Dept. de Fisica). 1981. 47p. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704380.

Lattice gauge theory with Z(2) symmetry (Ising model) is studied. Some aspects of this theory are also studied for the case with Z(N) symmetry.

3836 (INIS-SU—180, pp 19-26) **Present state of quantum electrodynamics.** Faustov, R.N. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Fiziko-Tekhnicheskikh i Radiotekhnicheskikh Izmerenij, Moscow (USSR)). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

Questions of a consecutive check of QED in the region of low and high energies are discussed as well as conditions for a better accuracy of the hyperfine structure constant, $\alpha$. To check QED in the low energy region, considered are: the electron- and muon anomalous magnetic moments; the spectra of hydrogen-like atoms- the hyperfine structure of muonium, positronium and muonic helium $(\mu^4He)^+$, and also the Lamb shift in hydrogen. Comparative evaluations of available experimental and theoretical data are made. Corrections are suggested to obtain a better aggreement between the experimental and theoretical evaluations. It is noticed that the introduction of a new PETRA accelerator with colliding electron-positron beams has widened the possibilities of checking the QED validity at high energies. The lower limits for the Asup(+-) parameters (in GeV), for the reactions $e^+e^- \to e^+e^-$, $e^+e^- \to \mu^+\mu^-$, $e^+e^- \to \gamma\gamma$, $e^+e^- \to tau^+tau^-$, obtained by different research groups are given in the table. The experiments, beside checking QED, confirm the properties of e, $\mu$, tau charged leptons to be universal, and in particular, the tau-lepton to be point-like.

3837 (INIS-SU—180, pp 80-98) **Grand unified asymptotic-free model.** Fradkin, E.S. (AN SSSR, Moscow. Fizicheskij Inst.). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

The SU(5) and $E_6$ asymptotic-free models are described. The first model is the most simple and economic model of the grand unification (GUM). The second model possesses a remarkable property: all fermions (and equally bosons) are in the same fundamental representation. The GUMs are constructed on the so-called "unstable" solutions of the renormalization-group equations. The differences between the SU(5) GUM model and the SU(5) model, proposed in 1974 by Geordge and Glashow, are shown. The most important of them are: a) the presence of the neutrino mass; b) the absence of other light neutrinos, except for $\nu$sub(e) and $\nu$sub($\mu$); c) the lifetime of the tau-lepton in the SU(5) GUM is by an order higher than that in the SU(5) standard model; d) the occurrence of a number of decay and production processes, but with the small probability; e) the potentiality to obtain atomic experimental results different from the Weinberg-Salam model and also an agreement of the results with the data of SLAC. A distinguishing feature of the $E_6$ GUM is the fact that its effective charges differ in the magnitude order from the effective charges in other models. Therefore, the effect of a spontaneous symmetry breaking on the effective charge at $10^{15}$ GeV is discussed and radiative corrections to the Green functions as well. The author is of the opinion that the SU(5) GUM describes all interactions in the low-energy range physically truly.

3838 **(ITEF—166(1982)) Stability regions of one-dimensional solitons of a charged scalar field.** Belova, T.I.; Voronov, N.A.; Konyukhova, N.B.; Parijskij, B.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1982. 26p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700005.

Numerical investigations into the stability of soliton solutions of the phi(x, t)=phi(x)esup(-i$\omega$t) type for the nonlinear equation of $d^2phi/dx^2-\sigma^2phi/dt^2=K^2phi-\mu^2{}'phi'^2phi+lambda'phi'^4phi$ in the two-dimensional space-time are given. Areas of parameter values, where these solutions are stable relative to small perturbations in the linear theory approximation have been determined.

3839 **(ITEP—96(1982)) Pionino: an argument against massless gluino.** Eides, M.I.; Vysotsky, M.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1982. 5p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700041.

Spontaneous R-invariance breaking in a low energy SUSY (supersymmetry) theory inevitably leads to an extra light pseudoscalar boson (pionino). As this possibility is experimentally excluded the R-invariance has to be broken explicity, for example by lagrangian gluino Majorana mass term.

3840 **(WIS-PH—82/42) Do 't Hooft anomaly equations know about Georgi-Glashow grand unification.** Davidson, A.; Sonnenschein, J. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Sep 1982. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700006.

We examine the embedding of SU(k)sub(HC) composite schemes within flavor-chiral color-asymptotically-free SU(N) grand unifying theories. It is shown that unless k = 3, the associated spector-composite structure conspires to be real under the residual gauge interactions. The exceptional n-preon SU(3)sub(HC) scheme is capable of supporting a non-exotic quark/lepton spectrum only if n = 4,5. The SU(8) embeddable n = 5 case leads to a multigenerational Georgi-Glashow SU(5) picture.

3841 **(WIS-PH—82/58) Complex Rishon-type unification.** Davidson, A.; Sonnenschein, J. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Dec 1982. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700047.

We present a flavor-chiral version of the Rishon model. The troublesome $\alpha$sub(C)→0 't Hooft limit is satisfied in a non-exotic manner. The scheme is SU(7) grand unified. Its uniqueness stems from the fact that a realistic SU(n)sub(HC) scenario is SU(N) embeddable only provided n = 3, with 4 (or 5) preons involved. A total number of three quark/lepton families is dictated by the overall renormalizability. The electric charge serves as the fourth-color.

3842 **(WIS-PH—82/60) Composite model for quarks and leptons.** Harari, H. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Dec 1982. 41p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700048.

We discuss the motivation for constructing composite models for quarks and leptons, the hopes we have for a successful model and the difficulties encountered, so far, in this field. This paper corresponds to the contents of lectures given at the SLAC Summer Institute (August 1982), at the DESY Workshop on "Electroweak Interactions at High Energies" (September 1982) and at the Solvay Conference at the University of Texas, Austin, Texas (November 1982).

3843 **(WIS-PH—83/3) Surface description of QCD with fermionic quark boundaries.** Burden, C.J. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Physics). Jan 1983. 27p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700050.

The flux sheet description of pure gauge theories proposed by Bardakci and Greensite is extended to include fermionic quark fields defined on the sheet boundaries. The quark fields are sources and sinks of colour flux and the action remains gauge invariant. It is shown that the partition function contains colour singlet contributions with the quantum numbers of mesons, baryons and exotics.

3844 **(WIS-PH—83/19) N = 2 two dimensional Wess-Zumino model on the lattice.** Elitzur, S.; Schwimmer, A. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Physics). Apr 1983. 23p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700007.

A lattice version of the N = 2 SUSY two dimensional Wess-Zumino model was constructed and studied. The correct continuum limit is checked in perturbation theory. The strong coupling limit is defined and investigated. We find that the ground state of the model has zero energy and infinite degeneracy. The connection between this degeneracy and the properties of the Nicolai-Parisi-Sourlas transformation is discussed.

3845 **(WIS-PH—83/23) Solitons in the Peierls condensate. I phase solitons.** Horowitz, B.; Krumhansl, J.A. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). May 1983. 49p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700008.

The electron-phonon system in one dimension is studied within the adiabatic (Hartree) and Hartree-Fock approximations. The equations of motion for the Peierls order parameter at zero temperature are derived from a microscopic Hamiltonian and an effective Lagrangian is constructed. Charged phase solitons describe systems whose electron density is at or near M fold commensurability with M >= 3. For M = 2 the order parameter is real in the adiabatic approximation, but becomes complex when both acoustic and optical phonons are coupled, or for a non-adiabatic theory. The latter is studied with Coulomb exchange force and phase solitons are derived. The soliton charge is 2/M for all M > = 2. When M = 4 the pinning potential can be anomalously low, in agreement with data on $TaS_3$ and similar compounds.

3846 **(WIS-PH—83/24) Fractional charge and anomalous commutators.** Frishman, Y.; Gepner, D.; Yankielowicz, S. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). Jun 1983. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700009.

Non-integer charges on topological objects in the presence of fermions are further investigated. The connection with anomalous commutators is discussed. The reason for the identical results in two-dimensional solutions and four-dimensional monopoles is pointed out.

3847 **Comment on "quark confinement and the Dirac equation".** Olsson, M.G. (Physics Department, University of Wisconsin, Madison, Wisconsin 53706). *American Journal of Physics;* **51**: No. 11, 1042-1043(Nov 1983). Contract AC02-76ER00881.

The effect of the "Klein paradox" on the quarkonium energy levels is discussed. (AIP)

3848 **Simple rules for discontinuities in finite-temperature field theory.** Weldon, H.A. (Department of Physics, University of Pennsylvania, Philadelphia, Pennsylvania 19104). *Physical Review* [*Section*] *D: Particles and Fields;* **28**: No. 8, 2007-2015(15 Oct 1983).

The discontinuity, or imaginary part, of the self-energy function at Tnot =0 is found to be of the form Γ = Γ/sub d/minus-orplusΓ/sub i/ for bosons and fermions, respectively. The generalized decay rate Γ/sub d/ and inverse decay rate Γ/sub i/ are recognizable as integrals over phase space of amplitudes squared, weighted with certain statistical factors that account for the possibility of particle absorption from the medium or particle emission into the medium. Nonequilibrium statistical mechanics shows that Γ gives precisely the rate at which the single-particle distribution function approaches the equilibrium form.

3849 **Feynman rules for gauge fields in the presence of a dielectric medium.** Perry, R.J. (Department of Physics and Astronomy, University of Maryland, College Park, Maryland 20742). *Physical Review* [*Section*] *D: Particles and Fields;* **28**: No. 8, 2099-2100(15 Oct 1983).

T. D. Lee's method for developing the Feynman rules for gauge fields in a cavity is reformulated in terms of path integral. His work is then extended by deriving these rules, in the Feynman gauge, for a spherical cavity. In any gauge only the gauge particle propagator is altered, while all the Feynman rules for gauge field couplings are left unaltered by the presence of a dielectric medium.

3850 **Monte Carlo studies of Wilson loops in SU(5) gauge theory in four dimensions.** Barkai, D.; Creutz, M.; Moriarty, K.J.M. (Center for Applied Vector Technology, Control Data Corporation at the Institute for Computational Studies, Colorado State University, Fort Collins, Colorado 80523). *Physical Review* [*Section*] *D: Particles and Fields;* **28**: No. 8, 2101-2103(15 Oct 1983). Contract AC02-76CH00016.

Monte Carlo simulations on a $6^4$ lattice are used to calculate Wilson loops, and hence the string tension, for pure SU(5) gauge theory. A bound is obtained for the string tension.

3851 **Bianchi-symmetric metrics.** Harvey, A. (Physics Department, Queens College City University of New York, Flushing, New York 11367). *Physical Review* [*Section*] *D: Particles and Fields;* **28**: No. 8, 2121-2121(15 Oct 1983).

New, simple, Bianchi I, II, and IX metrics are presented. They were obtained by means of computer-based algebraic manipulators. The scheme is described.

3852 **Symmetry and symmetry breaking in generalized parastatistics.** Levine, R.Y.; Tomozawa, Y. (Department of Physics, University of Michigan, Ann Arbor, Michigan 48109). *Annals of Physics (New York);* **149**: No. 2, 457-481(Sep 1983).

An analysis is made of the characteristics of internal symmetry and symmetry breaking in a quantum field theory with generalized parastatistics, defined by either double commutation relations or single commutation relations. The connection between the two statistics is clarified. We develop a formalism in which statistics is viewed as a dynamical or phase variable of quantum systems. It is shown that the types of Higgs phases possible depend upon statistics. Relationships between physical amplitudes implied by internal symmetry with normal statistics are violated in the case of generalized parastatistics.

3853 **Link fermions and dynamically correlated paths for lattice gauge theory.** Brower, R.C. (Harvard Univ., Cambridge, MA (USA). Lyman Lab. of Physics); Giles, R.C. (Massachusetts Inst. of Tech., Cambridge (USA). Lab. for Nuclear Science); Kessler, D.A. (Los Alamos National Lab., NM (USA). Theoretical Div.); Maturana, G. (California Univ., Santa Cruz (USA). Physics Dept.). *Physics Letters,* [*Section*] *B;* **126**: No. 5, 359-365(7 Jul 1983).

The calculation of fermion bound states in lattice QCD is discussed from the point of view of the Feynman path integral and the corresponding lattice 'path sum' representation of the fermion propagator. Path sum methods which correlate the trajectories of valence fermion and antifermion constituents of a meson bound state are presented. The resultant Monte Carlo algorithm for the meson propagator samples predominantly those configurations which are expected to be most important for a tightly bound system. Relative to other techniques, this procedure anticipates cancellations due to gauge field averaging, and in addition, allows a more detailed examination of the bound state wavefunction. Inspired by the fermionic path representation of the 2D Ising model, we also introduce a new class of lattice fermion actions with nearest neighbor interactions between Grassman variables associated with links. These link fermions are a simple generalization of Wilson's fermions. They have an additional corner weight param-

eter which can be adjusted to obtain a much improved dispersion relation for moderate and parge lattice momenta.

3854 **Do light colored scalars exist?.** Dawson, S.; Hill, C.T. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, Illinois 60510). *Annals of Physics (New York);* **148**: No. 2, 282-307(Jul 1983).

The general question of the properties of light, neutral colored spin-zero particles in QCD is examined. Models ith spontaneous breaking of QCD at very large distances, such as that of DeRujula, Giles, and Jaffe and the SO(3) scheme of Slansky, Goldman, and Shaw, require such light colored Higgs scalars. These scalars will form color-singlet hadronic bound states at short distances and estimates are given of bound state masses, decay widths, and production rates in processes such as psi $\rightarrow \gamma + X$ within the MIT bag model. The resulting states are expected in the mass neighborhood $\sim$1.5 GeV and should resemble glueballs.

3855 **Monte Carlo computations in lattice gauge theories.** Creutz, M. (Brookhaven National Lab., Upton, NY (USA). Physics Dept.); Jacobs, L. (California Univ., Santa Barbara (USA). Inst. for Theoretical Physics); Rebbi, C. (Brookhaven National Lab., Upton, NY (USA). Physics Dept.). *Physics Reports: A Review Section of Physics Letters (Section C);* **95**: No. 4, 203-282(Apr 1983).

With 120 refs.

The formulation of gauge theories on Euclidean space-time lattices and the application of the Monte Carlo computational technique to the ensuing systems are reviewed. A variety of numerical results obtained for lattice gauge theories are presented and discussed.

### 6455 Scattering Theory

*REFER ALSO TO CITATION(S) 3744, 4027*

3856 **Group theory approach to scattering.** Alhassid, Y.; Guersey, F.; Iachello, F. (A. W. Wright Nuclear Structure Laboratory, Yale University, New Haven, Connecticut 06511). *Annals of Physics (New York);* **148**: No. 2, 346-380(Jul 1983). Contract AC02-76ER03074;AC02-76ER03075.

We show that both bound and scattering states of a certain class of potentials are related to the unitary representations of certain groups. In this class, several potentials of practical interect, such as the Morse and Poeschl—Teller potentials, are included. The fact that not only bound states but also scattering states are connected with group representations suggests that an algebraic treatment of scattering problems similar to that of bound state problems may be possible.

## 65 PHYSICS RESEARCH

3857 **(INIS-mf—8567) Progress report 1981.** Chalupka, A.; Dirninger, G. (eds.). (Oesterreichische Akademie der Wissenschaften, Vienna). 1982. 31p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83703832.

The progress report describes the scientific work and research results of the institute for radium research and nuclear physics of the Austrian Academy of Sciences for the period of 1981. The progress report covers the subject areas of nuclear theory, nuclear model calculations, experimental nuclear physics and neutron involved reactions, medium energy physics, instrumentation and detectors, evaluation of nuclear data and numerical data processing, dating, applications in medicine, dosimetry and environmental studies. A list of publications of this institute is given.

3858 **(INIS-mf—8568) Progress report 1982.** Chalupka, A.; Wild, E.; Dirninger, G. (eds.). (Oesterreichische Akademie der Wissenschaften, Vienna). 1983. 38p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83703833.

The progress report describes the scientific work and research results of the institute for radium research and nuclear physics of the Austrian Academy of Sciences for the period of 1982. The progress report covers the subject areas of nuclear theory, nuclear model calculations, experimental nuclear physics and neutron involved reactions, medium energy physics, instrumentation and detectors, evaluation of nuclear data and numerical data processing, dating, applications in medicine, dosimetry and environmental studies. A list of publications of this institute is given.

3859 **(INIS-mf—8569) Progress report 1982.** Paul, H. (Johannes Kepler Univ., Linz (Austria)). 1983. 22p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703834.

This progress report describes the scientific work and research results done by the institute for experimental physics, atom and nuclear physics of the Johannes-Kepler-Universitaet Linz in the period of 1982. The covered subject areas are ionization by cations, investigations of surface areas by light ions, measurement of stopping power in solids, data acquisition and aerosol physics.

3860 **(INIS-mf—8570) Progress report 1981.** Paul, H. (Johannes Kepler Univ., Linz (Austria)). 1982. 18p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703835.

This progress report describes the scientific work and research results done by the institute for experimental physics, atom und nuclear physics of the Johannes-Kepler-Universitaet Linz in the period of 1981. The covered subject areas are ionization by cations, investigations of surface areas by light ions, measurement of stopping power in solids, data acquisition and aerosol physics.

3861 **(INIS-mf—8571) Progress report 1981/82.** Kocevar, P. (Graz Univ. (Austria)). 1982. 19p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703836.

This progress report describes the scientific work and research results of the institute for theoretical physics of the Karl-Franzens-Universitaet Graz for the period Oct. 1981 - Sept. 1982. A short description of the research projects is given covering the subject areas of electromagnetic processes, field theory, elementary particles, nuclear physics, semiconductor physics and quantum theory. A comprehensive list of publications is given.

### 6510 Nuclear Physics

*REFER ALSO TO CITATION(S) 2324, 2325*

3862 **(DOE/ER/05224—7) Research in experimental nuclear physics. Progress report, 1 April 1983-31 March 1984.** (Texas Univ., Austin (USA)). Nov 1983. Contract AS05-76ER05224. 12p. NTIS, PC A02/MF A01. Order Number DE84002583.

Portions are illegible in microfiche products.

This report summarizes the work carried out by personnel from the University of Texas at Austin at the Los Alamos Clinton P. Anderson Meson Physics Facility (LAMPF) during the calendar year 1983. The research activities involved experiments done with the Energetic Pion Channel and Spectrometer (EPICS), the High Resolution Spectrometer (HRS), and some work has been done at Argonne National Laboratory and Kernforschungsanlage, Juelich, West Germany. This report lists the published papers and preprints supported by this contract. (WHK)

3863 **(EUR—7926) 1981 Annual status report. Nuclear measurements.** (Commission of the European Communities, Geel (Belgium). Central Bureau for Nuclear Measurements). 1982. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703829.

The Nuclear Measurements programme is divided into two main projects, Nuclear Data on the one hand and Nuclear Reference Materials and Techniques on the other. In the former the JRC actions form part of world-wide sets of actions to establish reliable, and in many cases very precise, figures for important nuclear parameters - e.g. neutron interaction cross-sections, radio-nuclide half lives. In this work the Central Bureau for Nuclear Measurements

(CBNM) pays particular attention to the specific needs of the Community and to complement similar actions undertaken in the laboratories belonging to the Member States. Concerning Nuclear Reference Materials and Techniques the actions are to provide materials to which analytical and other measurements carried out in the nuclear industry or by the nuclear community can be referred. The basic aim of the Nuclear measurement programme is therefore to develop nuclear metrology with special orientation towards satisfying the demands for basic nuclear data and for materials and methods or reference.

3864 (LA—9798-P, pp 104-108) **New horizons in nuclear physics.** Gibbs, W.R.; Ginocchio, J.N.; Peng, J.C.; Stein, N. (Los Alamos National Lab, NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

New areas for nuclear physics research at LAMPF II are discussed including antiproton-nucleus physics, coherent meson production, quark degrees of freedom, and hyponuclei (nuclear matter with positive strangeness). (WHK)

3865 **Recent References January through April 1983.** Ramavataram, S. (Brookhaven National Laboratory, Upton, New York 11973). *Nuclear Data Sheets;* **37**: No. 4, 595-717(Dec 1982). Contract AC02-76CH00016.

Keywords, a reaction index, and references are given for literature received by the National Nuclear Data Center or assigned key numbers between January and April 1983. (AIP)

## 6512 Nuclear Properties And Reactions, A=1-5

*REFER ALSO TO CITATION(S) 3474, 3885*

3866 **(INIS-mf—8265) Study of the particle unstable S-nucleus resonances $^5$Lisup(3/2-) and $^5$Hesup(3/2-) in the reaction $\alpha$+d->$\alpha$+p+n at the c.m. energy Esub(CMS)=9,3 MeV.** Berghaus, U.F.W. (Hamburg Univ. (Germany, F.R.). Fachbereich Physik). 2 Feb 1982. 108p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE83704389.

The $\alpha$-particle induced Deuterium break-up was measured at a center of mass energy of 9.3 MeV in kinematically complete experiments. For the purpose of testing the dependence on charge caused effects (n, $\alpha$)- and (p, $\alpha$)-data of coincidence were taken simultaneously. The particle instable 5 nucleon systems $^5$Hesup(3/2-) and $^5$Lisup(3/2-), which occur for a short time as intermediate resonances in their ground states, were counted in an angular correlation experiment. For the detection of $\alpha$-particles emitted in the decay of the intermediate resonances a broad ranged but not local sensitive Si(Li)-detector was used, built up by the Schlumberger Company. The immediate produced protons in $\alpha$+d -> $^5$Hesup(*)+p were registered in normal sized Si(Li)-detectors made by KEVEX, the neutrons from $\alpha$+d -> $^5$Lisup(*)+n were measured with NE213 filled scintillation counters manufactures by Nuclear Enterprises. From the cross sections in the recoil center of mass system the four tensor polarizations for rank 2 were extracted and compared with the resonating group model of Hackenbroich et al. with respect to the different charged channels. The predictions for the energy (Tsub(p) or Tsub(n)) dependent cross section in the three particle break-up calculated by Koike using Faddeev theory and Hackenbroich using resonating group method are shown in comparison with the experimental results. Discrepancies are found especially in the $^5$He +p-channel and their increasing with the center of mass angle (THETAsub(CMC) approx.= 130°). By means of the angular-correlation function W(THETA, phi) a more strong coupling of the $^5$Lisup(*)+n-channel to the reaction plane compared with the $^5$Hesup(*)+p-channel was found at the same production angle (THETAsub(CMS) approx.= 99°). The features of Coulomb interaction are seen to be approximated too crude in both theoretical models.

3867 **(ISN—82-50) Weak nucleon-nucleon interaction in few body systems.** Avenier, M. (Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires). Nov 1982. 6p. (CONF-820991—3). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704289.

From 8. international workshop on weak interactions and neutrinos; Javea, Spain (5 Sep 1982).

The forward-backward asymmetry A$\gamma$ of the $\gamma$ ray angular distribution in the radiative capture of polarized neutrons by protons is a very sensitive test of the weak neutral current between nucleons. Due to the $\Delta S = 0$ rule and quark confinement, weak neutral effects appear only in low energy nucleon-nucleon interactions.

3868 **(JINR—E-2-82-409) Momentum spectra of light nuclei in reactions Ad → AX at large momentum transfers.** Saakian, S.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700066.

Within the multiple scattering model the inclusive cross sections $^3$Hed → $^3$HeX and $^4$Hed → $^4$HeX are calculated. At momentum transfers per nucleon of a scattered nucleus of 0.5 GeV/c in momentum spectra a fine structure arises because of the separation of contributions from different mechanisms of multiple scattering. In nucleon spectra in the reaction N$\pi$ → NX such a structure is suppressed by relativistic contraction.

3869 (LA—9798-P, pp 29-31) **Study of pion-nucleus reactions with high-energy pion beams.** Piasetzky, E. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

With the availability of higher energy pion beams at LAMPF II, one may expect to extend the study of pion-nucleus reactions to a higher energy region (300 MeV to 1.5 GeV). General motivation for the high-pion-energy studies is discussed and three typical experiments are proposed. These experiments are expected to give us extensive information pion absorption and production in nuclei as well as pion-induced nuclear knockout reactions.

3870 (LA—9798-P, pp 111-117) **Muon capture in nuclei.** Walecka, J.D. (Stanford Univ., CA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Muon capture plays a very important role in the elucidation of the structure of the semileptonic weak interactions; it can be used to place tight constraints on the form of the weak-current density in the nucleus. The nucleus presents an ideal microscopic laboratory for studying weak interactions. The many nuclear transitions and selection rules serve to isolate various pieces of the weak current. The present level of accuracy in the theoretical analysis, which uses electron scattering to determine one-body densities including both their spatial and spin dependences, is ~ 5 to 10%. An order-of-magnitude improvement in the experimental values of the partial-capture rates, as well as the systematic extension of measurements of partial-capture rates and corresponding correlation and polarization phenomena, should lead into a new realm where it is possible to study the effects of exchange currents in the nucleus on the weak axial-vector current.

3871 (LA—9798-P, pp 122-125) **Nuclear physics experiments using muons.** Walecka, J.D. (Stanford Univ., CA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A summary of possible new nuclear physics studies using muons emphasizes the advantages of future dc and pulsed muon beams at LAMPF II as well as the need for more precise muon capture measurements. Muonic x-ray and muon-induced fission experiments are also presented.

3872 **(LA-UR—83-2763) Deuteron forward photodisintegration: meson currents and relativity.** Friar, J.L. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 16p. (CONF-8310207—1). NTIS, PC A02/MF A01. Order Number DE84001314.

From Workshop on perspectives in nuclear physics at intermediate energies; Trieste, Italy (10 Oct 1983).

The few-nucleon problem in nuclear physics and the few-electron problem in atomic physics are shown to possess similarities. Relativistic aspects of the latter are reviewed. The radiative decay of the $^3P_1$ excited state of helium-like ions to the $^1S_0$ ground

state is shown to be a theoretical analogue of low-energy deuteron forward photodisintegration. Both have large relativistic components. The extended Siegert's theorem, which permits application of Siegert's technique to arbitrary photon wave lengths, is applied to both transitions. Physical arguments for the two processes are stressed, and the relevance of interaction currents is discussed. 28 references.

3873 **Effects of the $^3$He D state in the reaction $^2$H(p,γ)$^3$He.** King, S.E.; Roberson, N.R.; Weller, H.R.; Tilley, D.R. (Duke University, Durham, North Carolina 27706, and Triangle Universities Nuclear Laboratory, Durham, North Carolina 27706). *Physical Review Letters;* **51**: No. 10, 877-880(5 Sep 1983).

Angular distributions of the reaction $^2$H(p,γ) $^3$He have been measured for E/sub p/ from 6.5 to 16 MeV. A comparison of the extracted $a_2$ coefficients with an effective two-body direct calculation indicates a sensitivity to the inclusion of D-state components in the $^3$He wave function. These calculations use $^3$He bound-state wave functions generated from Faddeev-type equations. The theoretical three-body $^3$He ground-state wave functions having D-state probabilities of 5%—9% ($D_3$ = -0.224 to -0.236) are consistent with the present data.

3874 **Configuration space Faddeev continuum calculations: p-d s-wave scattering length.** Friar, J.L.; Gibson, B.F.; Payne, G.L. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 3, 983-994(Sep 1983).

Formulation of s-wave zero-energy Faddeev-type scattering equations including a Coulomb interaction is discussed. Numerical solutions of these equations for the s-wave NN potential models of Malfliet and Tjon are obtained using spline techniques. Kohn variational estimates are presented and comparison is made to previously published results. Our quartet pd scattering lengths are larger than others previously obtained, and our pd doublet results are smaller than the corresponding nd results, and thus in contrast to the experimental values. An explication of this feature is presented in terms of a model two-body problem. Perturbation theory for the Coulomb corrections to the scattering length is developed and confirms the Kohn estimates.

3875 **(CEA-CONF—6674) $^{20}$Ne induced peripheral reaction at 30 MeV/nucleon.** Cassagnou, Y.; Conjeaud, M.; Dayras, R.; Harar, S.; Legrain, R.; Pollacco, E.C.; Volant, C.; Menet, J.; Viano, J.B. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Jan 1983. 9p. (CONF-830117—15). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700073.

From 21. international winter meeting on nuclear physics; Bormio, Italy (24 Jan 1983).

Projectile-like fragment energy spectra from 30 MeV/nucleon Ne on C, Ni Ag and Au targets have been measured at different angles. A beam velocity and energy relaxed components are present in the spectra. Extracted values of the reduced momentum width $\sigma_0$ do not reach the fragmentation limit.

3876 **(CEA-CONF—6675) Projectile break-up of $^{14}$N at 62,7 MeV.** Bozek, E.; Cassagnou, Y.; Dayras, R.; Legrain, R.; Pagano, A.; Rodriguez, L.; Lanzano, G.; Palmeri, A.; Pappalardo, G. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Jan 1983. 10p. (CONF-830117—16). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700074.

From 21. international winter meeting on nuclear physics; Bormio, Italy (24 Jan 1983).

In plane and out of plane angular correlations between light particles and heavy ions have been measured in the reaction $^{14}$N + $^{12}$C at 62.7 MeV bombarding energy. Special attention has been given to the break-up of $^{14}$N into $^{13}$C + p, $^{12}$C + d and $^{10}$B + α. The observed correlations are consistent with sequential break-up of the $^{14}$N projectile. A Monte-Carlo calculation assuming isotropic emission of particles in the rest frame of the projectile from well defined states in $^{14}$N is in good agreement with the experimental angular correlations. From a comparison between calculated and experimental boron and carbon single energy spectra, it appears that after transfer reactions, sequential break-up of $^{14}$N is the dominant process to produce these nuclei.

3877 (LA—9798-P, pp 20-25) **Measurement of anti p, $K^{+-}$, and $\pi^{+-}$ scattering from $^{16}$O and $^{18}$O at 800 MeV.** Barnes, P.D.; Eisenstein, R.A.; Franklin, G.; Wharton, W.R. (Carnegie-Mellon Univ., Pittsburgh, PA). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Energy loss spectrometers were used to study the scattering of antiprotons, kaons, and pions from $^{16}$O and $^{18}$O, at 800 MeV/c. Angular distributions were measured for angles $2^\circ \leqq \theta \leqq 24^\circ$. For antiprotons, no such data existed, and the extent to which the NN (s-channel) absorption dominates the scattering process was of interest. If absorption strongly dominates, the opportunity exists for probing the far outer regions of the nuclear surface. If the absorption is not overwhelming, the (t-channel) meson exchange pieces of the N anti N force can be expected to play a role in the scattering. Because these are different from the NN force, we may be able to learn useful physics by comparing anti p scattering to the proton data from LAMPF. The L vector . S vector force is of special interest in this regard. For kaons, scattering from the isotopic pair $^{16}$O to $^{18}$O was studied to explore further the reliability of the currently used multiple-scattering calculations for this scattering process. Pion scattering at this higher momentum would nicely complement the work done at LAMPF, SIN, and TRIUMF at energies around the (3,3) resonance and below. A test of this model in a different energy range would be helpful. The fact that $\pi^+$N and $\pi^-$N amplitudes are related by isospin invariance will be useful in understanding better the role of the Coulomb-nuclear interference in the scattering.

3878 (LA—9798-P, pp 32-37) **Double-charge-exchange reactions.** Bland, L.C. (Univ. of Pennsylvania, Philadelphia); Morris, C.L. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Pion double-charge-exchange (DCX) reactions have provided many surprises from experimental studies performed at LAMPF. Features of the present data set may indicate that DCX proceeds by excitation of $\Delta_{33}$ components in nuclear wave functions. The larger resonance-energy pion fluxes expected from LAMPF II will enable more complete experimental studies, which will yield further insight into the DCX reaction mechanism.

3879 (LA—9798-P, pp 38-45) **Tests of the $K^+$-nucleon interaction in nuclei: an inelastic-scattering survey.** Hintz, N.M. (Univ. of Minnesota, Minneapolis). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A proposal is made to measure elastic and inelastic angular distributions for $K^+$ scattering from $^{12}$C, $^{28}$Si, and $^{58}$Ni at laboratory bombarding momenta of 600, 800, and 1000 MeV/c. Excitation of selected natural-parity [$^{12}$C($2^+$), $^{28}$Si($5^-$), $^{58}$Ni($6^+$)] and unnatural-parity [$^{12}$C($1^+$), $^{28}$Si($6^-$)] states will allow tests of the underlying $K^{+-}$ nucleon amplitudes as well as the determination of nuclear transition densities for comparison with similar measurements using other probes.

3880 (LA—9798-P, pp 135-138) **Activation studies of the interactions of kaons, antiprotons, and high-energy pions with complex nuclei.** Dropesky, B.J. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

We propose a number of exploratory activation studies of the interactions of kaons, antiprotons, and high-energy pions with complex nuclei. Because of the anticipated large contamination of the kaon beams with pions, studies of kaon interactions will necessarily involve difference measurements, which should be feasible. The range of studies proposed includes measurements of beam-monitor reactions, spallation distributions, charge-exchange reactions,

nuclear fragmentation, and pion production [$(\pi,2\pi)$, $(\pi,3\pi)$]. Special emphasis will be placed on trying to make a systematic comparison between reactions induced by $K^+$ and $K^-$. Comparisons with theoretical models will be essential for the interpretation of the observed phenomena.

3881 **Isobaric analog states in pion single-charge-exchange reactions on and above the (3,3) resonance energy.** Sennhauser, U.; Piasetzky, E.; Baer, H.W.; Bowman, J.D.; Cooper, M.D.; Matis, H.S.; Ziock, H.J.; Alster, J.; Erell, A.; Moinester, M.A. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review Letters;* **51**: No. 15, 1324-1327(10 Oct 1983).

The $0^0$ differential cross sections of $(\pi^+,\pi^0)$ reactions on a series of nuclei to isobaric analog states were determined at 165, 230, and 295 MeV. For each energy, the A dependence is well described by a power law of the form $\sigma$ = g(E)(N-Z)A/sup( - alphaE/), where $\alpha$(E) is a decreasing function of energy. The $0^0$ excitation functions peak around the (3,3) resonance energy for all nuclei except $^{90}$Zr. A possible explanation in terms of neutron and proton densities is discussed.

3882 **Inversion formula for the internucleus potential using sub-barrier fusion cross sections.** Balantekin, A.B.; Koonin, S.E.; Negele, J.W. (Center for Theoretical Physics, Laboratory for Nuclear Science, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 4, 1565-1569(Oct 1983). Contract AC02-76ER03069.

Subject to the assumption that sub-barrier fusion is described by an effective one-dimensional energy-independent local potential barrier, the Jeffreys-Wentzel-Kramers-Brillouin approximation for the fusion cross sections is inverted to determine this effective potential. Potential barriers, with their associated experimental errors, are presented for $^{12}$C+ $^{12}$C and $^{40}$Ca+ $^{40}$Ca, and the assumption of a local effective potential is shown to be inadequate for $^{64}$Ni+ $^{64}$Ni.

3883 **Factorization of fragment-production cross sections in relativistic heavy-ion collisions.** Olson, D.L.; Berman, B.L.; Greiner, D.E.; Heckman, H.H.; Lindstrom, P.J.; Crawford, H.J. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 4, 1602-1613(Oct 1983).

Analysis of the factorizability of several sets of fragment-production cross sections has been performed for $^{12}$C, $^{16}$O, $^{16}$O, and $^{56}$Fe projectiles in the 1 to 2 GeV/nucleon energy region for targets ranging from Be to U. The results of this analysis are considered in terms of geometrical concepts. No evidence is found that there is any dependence of fragmentation channel upon the impact parameter. It is found as well that the projectile dependence of the target factors is much less than that predicted by the abrasion-ablation theory, and also is less than that predicted by an excitation-decay model. Nevertheless, it appears that an excitation and decay mechanism is the dominant process in peripheral fragmentation.

3884 **Precompound analyses of spectra and yields following nuclear capture of stopped $\pi$p.** Blann, M. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 4, 1648-1662(Oct 1983).

The hybrid model has been modified for application in the energy region involved in capture of stopped negative pions (140 MeV). Comparisons of the improved formulation have been made with data from reactions induced by protons up to 164 MeV and the agreement was good. The model was used to predict n and p spectra and activation yields from stopped $\pi^-$ capture on targets from $^{12}$C to $^{209}$Bi, assuming a predominant quasideuteron capture mechanism. Predictions are given for primary versus secondary emission contributions to the spectra. Qualitative predictions for nn, np, and pp angular correlations are presented. Sensitivity of spectra and yields to parameters related to the nuclear density at which capture occurs is illustrated. While overall comparisons between calculated and experimental results are quite satisfactory, more detailed analyses suggest that a geometry dependent formulation integrating along the density profile for $\pi^-$ capture will be necessary, coupled with explicit treatment of enhanced nucleon emission probability versus nucleon induced reactions (due to momentum differences in the entrance channels) if such model results are to simultaneously reproduce particle spectra and yields.

3885 **Cross sections for the production of $^{11}$C in C targets by $^{12}$C at relativistic energies.** Smith, A.R.; McCaslin, J.B.; Geaga, J.V.; Hill, J.C.; Vary, J.P. (Lawrence Berkeley Laboratory, Berkeley, California 94720). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 4, 1614-1617(Oct 1983).

Cross sections for the production of $^{11}$C in C targets were measured using $^{12}$C ions with energies of 0.40, 1.05, and 2.1 GeV/nucleon. These measurements were undertaken for the purpose of establishing primary standards for use as beam monitors. Annihilation radiation from $^{11}$C(T/sub 1/2/ = 20.34 min) was counted using a large volume NaI detector. Cross sections of 63.5 +- 0.5, 57.4 +- 0.4, and 60.9 +- 0.6 mb, respectively, were obtained for 0.40, 1.05, and 2.1 GeV/nucleon $^{12}$C beams. The results are compared with earlier measurements of the cross sections in C targets using relativistic proton and $\alpha$ beams. Good agreement is found between the cross sections measured in this work and a simple Glauber theory.

3886 **Nuclear medium effects in pion elastic scattering and charge exchange.** Kaufmann, W.B.; Gibbs, W.R. (Department of Physics, Arizona State University, Tempe, Arizona 85281). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 3, 1286-1300(Sep 1983).

The three body approximation of the pion-nucleus optical model is used to calculate effective strengths to be used in conventional calculations. The resulting wave functions are used to calculate pion elastic scattering and single charge exchange. It is found that observed energy shifts in elastic scattering can be understood. Considerable change in the magnitude and shape (as a function of energy) of the charge exchange cross section is a direct result of these corrections.

3887 **Fusion and peripheral processes in the collisions of $^{20}$Ne+ $^{20}$Ne and $^{20}$Ne+ $^{16}$O.** Shapira, D.; DiGregorio, D.; del Campo, J.G.; Dayras, R.A.; Ford, J.L.C. Jr.; Snell, A.H.; Stelson, P.H.; Stokstad, R.G.; Pougheon, F. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 3, 1148-1160(Sep 1983).

Reaction products from the bombardment of $^{20}$Ne and $^{16}$O gas targets with $^{20}$Ne beams have been measured at five laboratory energies between 70 and 160 MeV. Fusion, deep inelastic, and quasielastic processes were studied. Large deep inelastic yields ($\sigma$/sub DI/> or $\approx$600 mb) with average Q values of -50 MeV are present at the highest energy. Analysis of the fusion cross sections for $^{20}$Ne+ $^{16}$O suggests that the maximum angular momentum in $^{36}$Ar populated via this entrance channel may be as low as 29 +- 2h.

3888 **Analysis of elastic and inelastic scattering of 162 MeV pions from $^{13}$C by an optical potential and a collective model.** Seestrom-Morris, S.J.; Dehnhard, D.; Franey, M.A.; Morris, C.L.; Boudrie, R.L.; Thiessen, H.A. (University of Minnesota, Minneapolis, Minnesota 55455 and Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 3, 1301-1308(Sep 1983).

Data for elastic scattering of $\pi^+$ and $\pi^-$ from $^{13}$C at T/sub $\pi$/ = 162 MeV between $\theta$/sub lab/ = $22^0$ and $105^0$ were analyzed by an optical model. Good fits were obtained with neutron and proton ground state densities of three-parameter Fermi shape having the same rms radius. Inelastic data for the quadrupole transitions to the $(3/2)^-$ (3.68 MeV) and $(5/2)^-$ (7.55 MeV) states and the octupole transition to a proposed $(5/2)^+$, $(7/2)^+$ doublet (11.82 MeV) were analyzed using a collective model. The extracted strengths for the neutron and proton parts of the transitions are compared to the results of electron scattering and $\gamma$-ray studies.

3889 **(CEA-CONF—6649) Demonstration of a large deformation in the first stage of the sequence reaction $^{12}C(^{28}Si,\alpha\alpha)^{32}S(g.s.)$ by analysis of angular correlation measurements.** Alamanos, N.; Le Metayer, C.; Levi, C.; Mittig, W.; Papineau, L. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Mar 1983. 7p. (In French). (CONF-830394—2). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700071.

From 7. biennial meeting of nuclear physics; Aussois, France (14 Mar 1983).

The measurement of angular correlations of light particles emitted in sequence by a highly excited compound nucleus yields information on the angular momenta of the transitions. Detailed statistical model calculations have been used for a particular study of the sequence emission of $\alpha$ particles in the $^{12}C + ^{28}Si$ reaction, which leads to the first excited states of $^{32}S$ with energies between 60 and 90 MeV. The formation cross-section of the compound nucleus is calculated. The measured angular correlations are well represented by a statistical model calculation with a large deformation in the $^{40}Ca \rightarrow ^{36}Ar$ transition. Such a large deformation is compatible with the fusion configurations given by TDHF calculations. Structures superimposed on the mean cross-section from the statistical model are seen and it is shown that they are not due only to statistical fluctuations.

3890 **(CEA-N—1466-Pt.8) Cross sections of nuclear reactions induced by protons, deuterons, and alpha particles. Pt.8 Chlorine.** Tobailem, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Mar 1983. 70p. (In French). NTIS (US Sales Only), PC A04/MF A01. Order Number DE84700075.

Cross sections are reviewed for nuclear reactions induced by protons, deuterons, and alpha particles on chlorine targets. When necessary, published experimental data are corrected, and when possible, excitation functions are proposed.

3891 **(DOE/ER/40048—73-L3) Giant dipole resonances built on excited states.** Snover, K.A. (Washington Univ., Seattle (USA). Dept. of Physics). 1983. Contract AC06-81ER40048. 32p. (CONF-830970—3; CONF-8309169—1). NTIS, PC A03/MF A01. Order Number DE84001549.

From International symposium on highly excited states and nuclear structure; Orsay, France (5 Sep 1983).

Portions are illegible in microfiche products.

The properties of giant dipole resonances built on excited nuclear states are reviewed, with emphasis on recent results. Nonstatistical (p,$\gamma$) reactions in light nuclei, and statistical complex-particle reactions in light and heavy nuclei are discussed. 27 references.

## 6515 Nuclear Properties And Reactions, A=39-58

*REFER ALSO TO CITATION(S) 3706, 3869, 3873, 3876, 3877, 3882, 3976*

3892 (LA—9798-P, pp 26-28) **Conventional nuclear physics at LAMPF II: $K^+$-nucleus elastic and inelastic scattering.** Hoffmann, G.W.; Ray, L.; Coker, W.R. (Univ. of Texas, Austin). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The 800-MeV/c K+ elastic- and inelastic-scattering experiments from $^{40}Ca$, $^{48}Ca$, and $^{54}Fe$ are proposed with an overall experimental energy resolution of 0.5 MeV. These experiments are expected to provide important information on the usefulness of $K^+$ as a new probe for nuclear structure studies.

3893 **Half-life of $^{44}Ti$.** Frekers, D.; Henning, W.; Kutschera, W.; Rehm, K.E.; Smither, R.K.; Yntema, J.L.; Santo, R.; Stievano, B.; Trautmann, N. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 4, 1756-1762(Oct 1983). Contract W-31-109-ENG-38.

The half-life of $^{44}Ti$ has been measured to be T/sub 1/2/ = 54.2 +- 2.1 yr, somewhat higher than previously published values of 46.4 +- 1.7 and 48.2 +- 0.9 yr. The present value was obtained from the specific activity and the radioisotope concentration of several $TiO_2$ samples, each spiked with a $^{44}Ti$ activity of about 1.2 $\mu$Ci. The specific activity was measured via the 1157 keV $\gamma$ line from the decay of the $^{44}Sc$ daughter. $^{44}Ti/Ti$ concentrations were measured with the Argonne FN tandem accelerator in conjunction with an Enge split-pole magnetic spectrograph using the technique of accelerator mass spectrometry. An overall sensitivity of $10^{-10}$ was achieved which proves accelerator mass spectroscopy to be a powerful tool for radioisotope detection also in a region of rather heavy ion masses. A detailed description of the subtleties of accelerator mass spectroscopy when applied to measure absolute radioisotope concentrations in this heavy mass region is presented.

3894 **Precompound analyses of $^{58-64}Ni(n,px)$ reactions.** Castaneda, C.M.; Ullmann, J.L.; Brady, F.P.; Romero, J.L.; King, N.S.P.; Blann, M. (University of California, Davis, California 95616). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 4, 1493-1497(Oct 1983).

Data for the inclusive (n,px) reaction for 60 MeV neutrons on /sup 58,60,62,64/Ni are presented. Angular distributions for Q-value bins show a decrease of the forward peaking of the proton emission with increasing neutron excess. A marked dependence of the angle integrated spectra on (N-Z) is observed. The data are compared to hybrid and geometry dependent hybrid model calculations. Although these results predict the general shape of the spectra, they do not account for (N-Z) dependence. A neutron skin, as given by a hydrodynamic model, is added to the geometry dependent hybrid model, which predicts a higher precompound decay for high impact parameters. These results agree much better with the N-Z dependence of the data.

3895 **Energy dependence of the relativistic impulse approximation for proton-nucleus elastic scattering.** Clark, B.C.; Hama, S.; Mercer, R.L.; Ray, L.; Hoffmann, G.W.; Serot, B.D. (Department of Physics, The Ohio State University, Columbus, Ohio 43210). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 3, 1421-1424(Sep 1983).

Results of relativistic and nonrelativistic impulse approximation calculations are compared for p+ $^{40}Ca$ elastic scattering observables between 181 and 1040 MeV. At 400 MeV and above the relativistic approach is superior, especially with regard to spin observables. Below 400 MeV neither calculation agrees well with experiment.

3896 **Level structure of $^{67}Ge$ and its implications for the general structure of nuclei in the 1f-2p shell.** Murphy, M.J.; Davids, C.N. (Physics Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 3, 1069-1079(Sep 1983).

From the results of prompt and $\beta$-delayed $\gamma$-ray singles and $\gamma$-$\gamma$ coincidence measurements, twenty-four excited states and forty-six gamma transitions are identified in the level scheme of $^{67}Ge$. Angular distributions and directional correlations of prompt $^{67}Ge$ gamma rays have been measured to obtain the spins of the $^{67}Ge$ ground state and excited states at 18.2, 122.7, 243.6, 711.3, and 1019.9 keV. Parities are assigned to the first five states on the basis of fp shell systematics and observed $^{67}Ge$ gamma-ray branching ratios. The 752-keV excitation energy of the first $(9/2)^+$ level in $^{67}Ge$ is determined from an excitation function for the $^{64}Zn(\alpha,n\gamma)^{67}Ge$ reaction. The angular distribution and correlation measurements also provide E2/M1 mixing ratios for the 104.4, 120.8, 122.7, 243.6, 589.0, and 897.5 keV $^{67}Ge$ gamma rays. The level scheme of $^{67}Ge$ and the corresponding schemes for /sup 63,65/Ni, /sup 65,67/Zn, and $^{69}Ge$ are observed to have strong similarities at low excitation. Systematic trends in E2 transition rates are interpreted in the context of shell and collective features of the nuclei. It is found that models based on a single particle coupled to a vibrational or deformed core do not explain the observed systematics, and are an inaccurate representation of these nuclei. The systematics do agree with a many-nucleon shell model emphasizing the short-range pairing interaction and configuration mixing for the valence neutrons.

3897 **Charge and mass exchange in $^{56}$Fe-induced reactions at 8.3 MeV/nucleon.** Breuer, H.; Mignerey, A.C.; Viola, V.E.; Wolf, K.L.; Birkelund, J.R.; Hilscher, D.; Huizenga, J.R.; Schroeder, W.U.; Wilcke, W.W. (Department of Physics and Astronomy, University of Maryland, College Park, Maryland 20742). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 3, 1080-1103(Sep 1983).

Projectilelike fragments from reactions of 465-MeV $^{56}$Fe projectiles with targets of $^{56}$Fe, $^{165}$Ho, $^{209}$Bi, and $^{238}$U have been measured as a function of energy loss, and neutron and proton number. The mass and charge of each fragment were uniquely determined with discrete resolution. Data were analyzed as a function of energy loss by fitting a two-dimensional Gaussian function to the neutron-proton distributions. The fit parameters provide a convenient basis for comparison with theoretical predictions. In addition, centroids and variances derived from more detailed one-dimensional Gaussian fits to isobaric charge distributions are presented. Results are given for measured data as well as for the primary fragment distributions after correction for the dominant neutron evaporation. The centroid data show that in the asymmetric reactions proton transfer from projectile to target nucleus is preferred while the average fragment neutron number is largely preserved. This produces a charge equilibration process which is dependent on energy loss within the combined systems. The neutron and proton variances indicate an early dominant neutron flow followed by a constant relative neutron and proton exchange rate at energy losses above about 30 MeV. The degree of correlation of the neutron-proton distributions increases with energy loss and is found to be strongly related to the potential energy surface. Consistently observed negative correlation coefficients at low energy losses suggest the possible importance of processes other than particle exchange in the early stages of the interaction. Variances for constant N, Z, and A are found to saturate at energy losses and with magnitudes dependent on the target nucleus.

3898 **Neutron-induced gamma-ray production in $^{57}$Fe for incident neutron energies between 0.16 and 21 MeV.** Bell, Z.W.; Dickens, J.K.; Larson, D.C.; Todd, J.H. (Oak Ridge National Laboratory, P.O. Box X, Oak Ridge, Tennessee 37830). *Nuclear Science and Engineering;* **84**: No. 1, 12-29(May 1983).

Interactions of neutrons with the iron isotope $^{57}$Fe have been studied by measuring gamma-ray production cross sections for incident neutron energies between 0.16 and 21 MeV. Neutrons produced by the Oak Ridge Electron Linear Accelerator impinged on a metallic iron sample enriched to 93% in the isotope $^{57}$Fe. The resulting gamma radiation was detected using a 100-cm$^3$ Ge(Li) detector placed at 125 deg with respect to the neutron beam line. A complete description of the experiment is given. Absolute gamma-ray production cross sections were measured for gamma rays corresponding to the $^{57}$Fe(n,n$^1\gamma$)$^{57}$Fe, $^{57}$Fe(n,$\gamma$)$^{58}$Fe, $^{57}$Fe(n,$\alpha$)$^{54}$ Cr, $^{57}$Fe(n,2n)$^{56}$Fe, and $^{57}$Fe(n,p)$^{57}$Mn reactions. The cross section for the $^{57}$Fe(n,2n)$^{56}$Fe reaction exceeds 1 b for E /SUB n/ about 15 MeV, and the cross section for the $^{57}$Fe(n,p)$^{57}$Mn reaction exceeds 0.2 b for E /SUB n/ about 9 MeV. A new excited state is postulated account for observed data. Several new transitions are reported for decay of levels in $^{57}$Fe. Measured cross sections are compared with data obtained from the current ENDF/B evaluation.

3899 **(IPNO-DRE—83-02) Complementary investigation of neutron-rich exotic nuclei in the region of Fe, Ni and Zn.** Bernas, M.; Dessagne, P.; Langevin, M.; Payet, J.; Pougheon, F.; Roussel, P.; Schmidt Ott, W.; Tidemand-Peterson, P. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1983. 24p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700076.

The results of $^{14}$C induced transfer reactions performed with the Orsay MP Tandem accelerator on neutron rich targets nuclei $^{64}$Ni, $^{70}$Zn and $^{76}$Ge are given. Two proton pick-up were measured ($^{14}$C,$^{16}$O) as well as the next transfers ($^{14}$C,$^{17}$O) and ($^{14}$C,$^{18}$O). These measurements complete the results of the on line mass separation techniques applied to nuclei produced in deep inelastic or fragmentation reactions.

3900 **(JINR—E-4-82-512) Two-quasiparticle strength distributions in $^{62}$Ni and $^{206}$Pb.** Voronov, V.V.; Zhuravlev, I.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700067.

The fragmentation of two-quasiparticle states in $^{62}$Ni and $^{206}$Pb is calculated within the quasiparticle-phonon nuclear model. Experimental data for the one-nucleon transfer reaction spectroscopic factors and theoretical results are compared.

3901 **(LA—9798-P, pp 152-154) Nuclei far from stability produced by high-energy protons.** Bunker, M.E.; Butler, G.W.; Dropesky, B.J.; Talbert, W.L.; Vieria, D.J. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Two powerful and complementary techniques are described that could be used advantageously at LAMPF II for studying short-lived nuclei far from the line of beta stability, produced through fission or spallation reactions. The ground-state and excited-state properties of such nuclei are of great interest to nuclear model theorists. One of the proposed techniques utilizes a new type of recoil time-of-flight spectrometer that would enable the direct mass measurement of some 50 new neutron-rich isotopes in the light mass ($A < 70$) region with accuracies of 50 keV to 1 MeV. The second technique involves a so-called helium-jet-coupled mass separator, which would facilitate mass and spectroscopic measurements on short-lived isotopes of a number of elements (for example, refractory metals) that cannot be studied at any of the existing or planned on-line mass-separator facilities.

3902 **Estimation of neutron-induced spallation yields of krypton isotopes.** Karol, P.J.; Tobin, M.J.; Shibata, S. (Department of Chemistry, Carnegie-Mellon University, Pittsburgh, Pennsylvania 15213). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 4, 1850-1852(Oct 1983).

A procedure is outlined for estimating cross sections for neutron-induced spallation products relative to those for proton-induced reactions. When combined with known proton spallation systematics, it is demonstrated that cumulative yields for cosmogenically-important stable $^{84}$Kr and $^{86}$Kr isotopes are ~1.4 and ~2.8 times greater, respectively, for incident neutrons compared to protons at 0.2< or =E< or =3.0 GeV for nearby medium mass targets. Yields for lighter kryptons are relatively insensitive to the identity of the incident nucleon.

3903 **Onset of damping in energetic heavy-ion interactions.** Kowalski, L.; Haustein, P.E.; Cumming, J.B. (Chemistry Department, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **51**: No. 8, 642-645(22 Aug 1983).

Measurements of longitudinal momenta transferred to mass-identified products of the fragmentation of Cu by $^{12}$C ions give clear evidence for a change in reaction mechanism between 22 and 84 MeV/u. Results at 84 MeV/u are generally consistent with peripheral interactions. However, at 22 MeV/u large momentum transfers observed for near-target products suggest that strongly damped processes have become important. Limits to momentum transfer of the type reported by Galin et al. are shown to arise in a natural way from this transition.

3904 **(DOE/ER/02853—20) Studies of spin excitations with electromagnetic and hadronic probes.** Lindgren, R.A.; Petrovich, F. (Massachusetts Univ., Amherst (USA). Dept. of Physics and Astronomy; Florida State Univ., Tallahassee (USA). Dept. of Physics). 1982. Contract AC02-76ER02853. 32p. (CONF-820357—9). NTIS, PC A03/MF A01. Order Number DE84002648.

From International conference on spin excitations in nuclei; Telluride, CO, USA (25 Mar 1982).

Portions are illegible in microfiche products.

Excitation of unnatural parity states, predominantly of high spin, using electromagnetic and hadronic probes, is discussed. Spectroscopic strengths are deduced from studies of (e,e'), (p,p'), ($\pi$,$\pi$'), and (p,n) for states whose doorway is the stretched particle-hole configuration. These levels are excited primarily through the isovector electromagnetic-nucleon magnetization coupling, nucleon-nucleon tensor coupling, and pion-nucleon spin-orbit coupling. The extracted isovector spectroscopic strength is typically 38% of the extreme single particle-hole model and about 66% of that predicted by more realistic nuclear structure calculations. The observed isoscalar strength is only about one half of the isovector strength. The results obtained with the three different probes are quite consistent. The primary conclusion is that the missing strength for these high spin excitations is at least as large as for the low spin M1 and GT excitations. This implies the existence of other important quenching mechanisms since the $\Delta$-$N^{-1}$ mechanism involved in the discussion of the low spin excitation affects only the isovector transitions and contributes little to high spin excitations. A method for using (e,e') and $\pi^+/\pi^-$ cross section ratios to separate and determine the absolute isoscalar and isovector spin densities for $T_0$ to $T_0$ transitions in N is not equal to Z nuclei is also discussed and some comments on extracting information from (e,e') and (p,p') studies at high q on low spin $1^+$ and $2^-$ levels are presented. 78 references.

3905 **(DOE/ER/40097—1) Studies of neutron resonances in far-unstable nuclides via beta-delayed neutron energy spectra.** Clark, D.D.; McElroy, R.D.; Yeh, T.R.; Chrien, R.E.; Gill, R.L. (Cornell Univ., Ithaca, NY (USA). Ward Lab.; Brookhaven National Lab., Upton, NY (USA)). 1983. Contract AC02-83ER40097. 20p. (CONF-830833—4). NTIS, PC A02/MF A01. Order Number DE84001129.

From International conference on nuclear physics; Florence, Italy (29 Aug 1983).

Portions are illegible in microfiche products.

An extensive program to obtain high resolution energy spectra of delayed neutrons of 1 to 100 keV energy from mass-separated fission products is under way using the on-line separator TRISTAN at the Brookhaven National Laboratory High Flux Beam Reactor. A time-of-flight method is employed, with Li-6 neutron and plastic beta scintillation detectors providing start and stop signals; the flight time and both detector pulse heights are recorded in event mode. With a flight path of 50 cm and FWHM time resolution of 2.9 ns, calculated FWHM energy resolutions are 2.1% at 3 keV and 5.5 at 100 keV. Transmission dips using a Cf-252 neutron source and Teflon absorbers are being measured to obtain empirical resolution functions at 27, 49 and 97 keV. Runs to date have been on Rb isotopes; in Rb-95, for example, peaks are found (intensities in parentheses) at 12.0 +- 0.2, 14.2 +- 0.1 (100), 26.3 +- 0.3 (2415), 56.5 +- 0.6, 64.3 +- 0.7 (8 +- 3), 93.3 +- 1 (20 +- 10), 103 +- 2, 120 +- 1.4, and 133 +- 2 keV. The end-point energy of the beta spectrum in coincidence with the 14-keV neutrons verifies that they populate the ground state of the GC nuclide, Sr-94. The observed FWHM of the 14-keV peak is 0.58 +- 0.07 keV, from which a (preliminary) natural line width of 0.30 +- 0.04 keV is deduced using the calculated system resolution. Further analyses and runs on other nuclides are planned. Reproductions of materials used in a poster presentation are given. (WHK)

3906 **(IPNO-DRE—83-07) Some aspects of recent progress in the study of giant resonances.** Frascaria, N. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Mar 1983. 23p. (In French). (CONF-830394—3). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700077.

From 7. biennial meeting of nuclear physics; Aussois, France (14 Mar 1983).

A brief review of the results obtained during the last few years in the study of giant resonances is given. Attention is then focused on the experiments using high energy hadron and heavy ion projectiles. The problems inherent to these new type of experiments are discussed.

3907 **(JINR—E-1-82-719) Experimental study of the pion-xenon collisions without particle production at 3.5 GeV/c: asymmetry in proton emission.** Strugalski, Z.; Pawlak, T.; Pluta, J. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1982. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704290.

In hadron-nucleus collision events without particle production, when the incident hadrons are deflected only in their passage through the target-nuclei accompanied by intensive target-nucleon emission, three planes can be naturally distinct - the hadron deflection plane and two planes simply related to it; the related planes are normally situated to the deflection plane. Asymmetries in proton emission, relative to two of these planes are found. Experimental data characterizing these asymmetries are presented.

3908 (LA—9798-P, pp 17-19) **Nuclear structure and nuclear reactions.** Gibbs, W.R.; Gibson, B.F.; Ginocchio, J.N.; Strottman, D. (comps.). (Los Alamos National Lab., TN). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Some of the possible uses of high energy pion and kaon beams for nuclear structure studies are discussed. (WHK)

3909 (LA—9798-P, pp 109) **Search for $K^+$-nucleus states with positive strangeness by the ($K^+$,p) knockout reaction.** Peng, J.C.; Stein, N.; Drake, D.M. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Using the ($K^+$,p) knockout reaction, this experiment proposes to search for possible $K^+$-nucleus bound or resonant states. Such states would indicate a form of nuclear matter possessing positive strangeness. The quasi-free knockout reaction $K^+p \rightarrow pK^+$ is the main experimental background anticipated.

3910 (LA—9798-P, pp 110) **Nuclear physics studies with muons.** Heffner, R.H. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

In addition to providing important information on fundamental symmetries and interactions, muon-capture studies can also be used to elucidate important features on nuclear structure. For example, the total muon-capture process is not thought to be dominated by capture through giant resonances; thus collective nuclear excitations and high-spin states are amenable to study. Note that the capture matrix elements measure the nuclear axial-vector transition densities. In this regard, Walecka has pointed out that the combination of (e,e') studies and muon-capture reactions can be used to answer fundamental nuclear structure questions such as whether one requires two-body densities for semileptonic transitions. Also, muon-induced fission in heavy promises to be an important tool for studying the dynamics of the fission process. (WHK)

3911 (LA—9798-P, pp 128) **Nuclear chemistry.** Dropesky, B.J.; Liu, L.C. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The prospect of high-intensity beams of kaons, antiprotons, and high-energy pions and protons from LAMPF II opens many exciting avenues of research for the nuclear chemistry community. In general, we emphasize direct determination of dynamic properties of the final nuclei in a nuclear reaction. These studies, although

inclusive, can be done efficiently and will provide information to guide the planning of more elaborate investigations.

3912 (LA—9798-P, pp 129-134) **New scientific information from LAMPF II.** Liu, L.C. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A large quantity of new information concerning nuclear structure, nuclear reaction mechanisms, and basic hadronic interactions inside a nucleus can be obtained by the use of high-energy pions and strange particles at LAMPF II. The possibility of studying these mesonic and strangeness degrees of freedom of a nucleus will undoubtedly provide new and excellent testing grounds for our current understanding of the nucleus and of the strong interaction as a whole.

3913 (LA—9798-P, pp 146-147) **Singles and coincidence γ-ray experiments in $K^+$ and $K^-$ scattering on nuclei.** Lind, V.G. (Utah State Univ., Logan). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Prompt nuclear gamma rays from experiments of fast $K^{+-}$ interactions with nuclei provide a powerful and unique method for studying K-meson absorption and scattering in nuclei as well as the formation and decay of numerous hypernuclei and, hence, the role of the strange quark in the nuclear environment. Nuclear structure information also may be obtained from such experiments.

3914 (LA-UR—83-2927) **Dependence of the excitation energy, width, and cross section of the isovector monopole resonance.** Bowman, J.D.; Baer, H.W.; Cooper, M.D.; King, N.S.P.; Matis, H.S.; Piasetzky, E.; Alster, J.; Erell, A.; Lichtenstadt, J.; Sennhauser, U. (Los Alamos National Lab., NM (USA); Tel Aviv Univ. (Israel); Arizona State Univ., Tempe (USA); Schweizerisches Inst. fuer Nuklearforschung, Villigen). 1983. Contract W-7405-ENG-36. 6p. (CONF-830970—4). NTIS, PC A02/MF A01. Order Number DE84001908.

From International symposium on highly excited states and nuclear structure; Orsay, France (5 Sep 1983).

We have used the $(\pi^-,\pi^0)$ charge-exchange reaction at 165-MeV kinetic energy to study the T + 1 component of the isovector monopole resonance (IVM). The nuclei $^{40}$Ca, $^{61}$Ni, $^{90}$Zr, $^{120}$Sn, $^{140}$Ce, and $^{208}$Pb were used as targets. We also observed the T + 1 component of the giant dipole resonance (GDR) in the lighter targets. The $(\pi^+,\pi^0)$ reaction also yielded positive results for the T - 1 component of the IVM and GDR in $^{40}$Ca, $^{60}$Ni, and $^{90}$Zr. Results are reported.

3915 (NEANDC—J-91/U) **JNDC nuclear data library of fission products.** Tasaka, K.; Ihara, H.; Akiyama, M.; Yoshida, T.; Matumoto, Z.; Nakasima, R. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Oct 1983. 224p. (JAERI—1287; INDC(JAP)—78/L). NTIS (US Sales Only), PC A10/MF A01. Order Number DE84900011.

Portions are illegible in microfiche products.

The JNDC (Japanese Nuclear Data Committee) FP (Fission Product) nuclear data library for 1172 fission products is described in this report. The gross theory of beta decay has been used extensively for estimating unknown decay data and also some of known decay data with poor accuracy. The calculated decay powers of fission products using the present library show excellent agreement with the latest measurements at ORNL (Oak Ridge National Laboratory), LANL (Los Alamos National Laboratory) and UTT (University of Tokyo, Tokai) for cooling times shorter than $10^3$s after irradiation. The calculated decay powers by the existing libraries showed systematic deviations at short cooling times; the calculated beta and gamma decay powers after burst fission were smaller than the experimental results for cooling times shorter than 10 s, and in the cooling time range 10 to $10^3$s the beta-decay power was larger than the measured values and the gamma decay power smaller than the measured results. The present JNDC FP nuclear data library resolved these discrepancies in the short cooling time ranges. The decay power of fission products has been calculated for ten fission types and the results have been fitted by an analytical function with 31 exponentials. This permits the easy application of the present results of decay power calculations to a LOCA (Loss-of-Coolant Accident) analysis of a light water reactor and so on.

3916 **Delayed neutron precursors at masses 97—99 and 146—148.** Reeder, P.L.; Warner, R.A. (Pacific Northwest Laboratory, Richland, Washington 99352). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 4, 1740-1751(Oct 1983). Contract AC06-76RL01830.

Delayed neutron emission probabilities, P/sub n/, have been measured for /sup 98,99/Sr, $^{97}$Y/sup g/,m, $^{98}$Y/sup g/, $^{99}$Y, $^{147}$Ba, and /sup 147,148/La. This is the first reported measurement for $^{97}$Y/sup m/. Upper limits to the P/sub n/ for $^{97}$Sr, /sup 146,148/Ba, and $^{146}$La were established. The P/sub n/ values measured here are much smaller than a set of published measurements. Calculations of total delayed neutron yields from fission are consistent with experimental measurements of total delayed neutron yields except for fast neutron fission of $^{238}$U. Improved half-lives are reported for 13 of the Rb, Sr, Y, Cs, Ba, and La nuclides at masses 97—99 and 146—148.

3917 **Excitation of the isoscalar giant quadrupole resonance in $^{118}$Sn$(\pi^{+-},\pi^{+-\prime})$.** Ullmann, J.L.; Kraushaar, J.J.; Masterson, T.G.; Peterson, R.J.; Raymond, R.S.; Ristinen, R.A.; King, N.S.P.; Boudrie, R.L.; Morris, C.L.; True, W.W. (University of Colorado, Boulder, Colorado 80309). *Physical Review Letters;* **51**: No. 12, 1038-1041(19 Sep 1983).

The isoscalar giant quadrupole resonance is studied in $^{118}$Sn$(\pi^{+-},\pi^{+-\prime})$ at 130 MeV. It is found that the ratio of $\pi^-$ to $\pi^+$ cross sections at their maximum is 1.9 and that 57% of the energy-weighted sum rule is exhausted in $\pi^-$ scattering. This large ratio of $\pi^-$ to $\pi^+$ cross sections is not anticipated by conventional models, and may be interpreted as evidence for substantial isovector strength.

3918 **Rotational structure and Nilsson orbitals for highly deformed odd-A nuclei in the A∼100 region.** Wohn, F.K.; Hill, J.C.; Petry, R.F.; Dejbakhsh, H.; Berant, Z.; Gill, R.L. (Ames Laboratory, U.S. Department of Energy and Iowa State University, Ames, Iowa 50011). *Physical Review Letters;* **51**: No. 10, 873-876(5 Sep 1983).

Six rotational bands have been found in $_{39}{}^{99}Y_{60}$, 1 $_{39}{}^{01}Y_{62}$, $_{38}{}^{99}Sr_{61}$, and 1 $_{40}{}^{01}Zr_{61}$. All bands have small and very similar values of $h^2/2$ scrI that indicate deformations of ∼0.3—0.4 and imply that these nuclei are among the most deformed known, with scrI∼0.8 scrI/sub rigid/. Relative strengths of intraband γ transitions suggest Nilsson orbital assignments of π 5/2 [422] for the Y ground bands.

3919 **Gamow-Teller strength function for $^{90}$Zr: Effects of spin and isospin exchange forces, and ground-state correlations.** Mathews, G.J.; Bloom, S.D.; Hausman, R.F. Jr. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 3, 1367-1373(Sep 1983).

Shell-model calculations of the Gamow-Teller strength function for $^{90}$Zr have been performed utilizing a realistic finite-range two-body interaction in a model space consisting of the 2p and 1g shells. The effects of admixtures of two-particle two-hole excitations in $^{90}$Nb, mostly due to the spin and isospin exchange components of the nucleon-nucleon force, are discussed. Ground state correlations in $^{90}$Zr are also added via seniority-zero two-proton excitations from the 2p shell into the 1g/sub 9/2/ shell. With the correlations the Gamow-Teller strength function is in good agreement with the experimental results and accounts for essentially all of the observed dispersion of strength. The inclusion of these correlations does not, however, produce either a displacement of Gamow-Teller strength to higher excitation energies, or a significant change in the total strength. Thus, they cannot account for the observed Gamow-Teller quenching. The quenching factor derived by a comparison of our calculated results with experiment is 0.52.

3920 **Spherical, oblate, and prolate nuclear shapes near $^{146}$Gd.** Chasman, R.R. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 3, 1374-1378(Sep 1983). Contract W-31-109-ENG-38.

Proton and neutron single particle level spacings are determined for the A = 146 mass region, using a rotationally invariant interaction and recent experimental data. Excitation energies of spherical and deformed high spin states in $^{147}$Gd, the transition probability B(E2; $10^+ \rightarrow 8^+$) for several N = 82 isotones, and the $0^+$ excited state spectra of, and neutron pair transfer probabilities for, levels in $^{146}$Gd and $^{144}$Sm are calculated. Comparisons with experimental data are made.

3921 **Z dependence of strongly interacting relativistic nuclear fragments.** Mac Gregor, M.H. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review Letters;* **49**: No. 25, 1815-1818(20 Dec 1982). Contract W-7405-ENG-48.

Three different experimental groups have recently published the results of their investigations on highly interacting relativistic nuclear fragments (denoted as "anomalons"). These results are combined to form an anomalon data base, and then chi$^2$ analyses are used to demonstrate that the anomalon mean free paths are Z dependent. It is also demonstrated that these anomalon mean free paths lie on the boundary that delineates the "domain of nuclear forces."

3922 **(DOE/ER/10599—21) Nuclear structure from radioactive decay. Annual progress report.** Wood, J.L. (Georgia Inst. of Tech., Atlanta (USA). School of Physics). 30 Sep 1983. Contract AS05-80ER10599. 15p. NTIS, PC A02/MF A01. Order Number DE84002643.

Studies of neutron-deficient nuclei around the Z = 82 shell closure, with special emphasis on the levels of the odd-mass Pt, Au, Hg, and Tl isotopes are described. Research on nuclear systematics and models is discussed, and publications are listed. (WHK)

3923 **(JINR—R-4-82-531) Vibrational states of deformed odd nuclei.** Solov'ev, V.G.; Nesterenko, V.O.; Bastrukov, S.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700068.

The equations for the description of vibrational states in deformed odd-A nuclei are obtained within the quasiparticle-phonon nuclear model. In these equations the Pauli principle is taken into account in the quasiparticle plus phonon components of the wave functions. It is shown that if in these components the Pauli principle is not violated or is slightly violated, the corresponding vibrational states may exist in deformed odd-A nuclei. If the Pauli principle is strongly violated in the quasiparticle plus phonon state, its centroid energy is shifted towards higher energies, and it can be fragmented over several levels. The analysis of the available experimental data on the low-lying vibrational states in deformed odd-A nuclei from $^{179}$Hf-$^{239}$Pu range has shown that the experimental data do not contradict the results of these calculations.

3924 **Nuclear data sheets for A = 153.** Lee, M.A. (Idaho National Engineering Laboratory EG & G Idaho, Inc., Idaho Falls, Idaho 83415). *Nuclear Data Sheets;* **37**: No. 3, 487-594(Nov 1982).

The experimental results from the various reaction and decay studied leading to nuclides in the A = 153 mass chain have been reviewed. These data are summarized and presented, together with the adopted level schemes and properties.

3925 **(CEA-CONF—6651) Projectile fragmentation and light particle emission from 70 MeV/nucleon $\alpha$ particles on $^{197}$Au.** Blumenfeld, Y.; Cassagnou, Y.; Conjeaud, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Jan 1983. 11p. (CONF-830117—14). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700072.

From 21. international winter meeting on nuclear physics; Bormio, Italy (24 Jan 1983).

Light particles (p,d,t,$^3$He) energy spectra from 70 MeV/nucleon $\alpha$ on $^{197}$Au have been measured at angles ranging from $10^0$ to $30^0$ in the laboratory. The results have been analysed in terms of fragmentation and moving thermal source models. It is shown that $\alpha$ induced data display similar features as heavy ions data.

3926 **(CTA-EAV—001/81) Decay of 399 KeV isomeric state in $^{197}$Pt. A possible candidate for PAC studies.** Soares, J.C.; Melo, A.A.; Gil, F.B.; Saxena, R.N.; Dias, H. (Centro Tecnico Aeroespacial, Sao Jose dos Campos (Brazil). Inst. de Atividades Espaciais). Feb 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704288.

The nuclear levels in $^{197}$Pt have been studied from decay of 95.4 min $^{197}$(sup m)Pt. The isomeric state was produced by (n,$\gamma$) reaction on the enriched $^{196}$Pt. The $\gamma$-ray spectra have been observed with a hyperpure Ge detector and a large volume Ge(Li) detector. The half lives of the 399 KeV and the 53 KeV states were determined with improved precision. The results are: T1/2 (399 KeV) = 95.41 +- 0.18 min and T1/2(53 KeV) = 16.58 +- 0.17 ns. The g-factor of the 53 Kev $5/2^-$ state has been measured by the gamma-gamma time differential perturbed angular correlation (TDPAC) method in an external magnetic field of 25.1 kG using the 346 - 53 KeV gamma cascade. The value of g-factor was obtained to be + 0.335 +- 0.010. This result is compared with the known g-factors of the similar states in $^{196}$Pt, and in $^{197}$Hg and $^{199}$Hg and also with the theoretical calculations based on the quasiparticle-phonon coupling scheme. Possibility of using the 346 - 53 KeV gamma cascade in $^{197}$Pt in the future TDPAC studies is discussed.

3927 **(INIS-mf—8257) Spectroscopy of the neutrons from the decay of the giant quadrupole resonance region in $^{208}$Pb.** Steuer, H. (Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.). Naturwissenschaftliche Fakultaet 1 - Mathematik und Physik). 21 Jul 1981. 77p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE83704388.

In the present thesis the neutron decay of the giant quadrupole resonance region in $^{208}$Pb was studied by the reaction chain $^{208}$Pb($\alpha$,$\alpha'$)$^{208}$Pbsup(GR)(n)$^{207}$Pb. For this at the Karlsruhe Isochronous Cyclotron an $\alpha'$-n coincidence experiment was performed with the energy-analyzed $\alpha$-beam of 104 MeV. The aim of this experiment was to determine the relative branching ratios of the neutron decay to the different states in the nuclear $^{207}$Pb. The branching ratios obtained from the experimental data show that the isomeric $13/2^+$ state is relatively strong populated from the decay of the giant E2-resonance region between 8.5 MeV and 12.5 MeV excitation energy in $^{208}$Pb. A comparison with the branching ratios, which were calculated for the different multipolarities in the framework of the statistical decay model, shows that because of the strong population of the $13/2^+$ state large contributions of multipolarities with L>=4 must be present in the giant E2-resonance region. The $\alpha$-spectra coincident to the single neutron decay channels show remarkable fine structure, especially also the strength distribution, which decays to the $13/2^+$ state.

3928 **(LA—9798-P, pp 148-150) Nuclear fragmentation by relativistic $K^{+-}$, anti p, $\pi^{+-}$, and p projectiles.** Kaufman, S.B. (Argonne National Lab., IL). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

The emission of light nuclear fragments by complex nuclei interacting with relativistic projectiles is discussed. Two types of experiments using kaons, antiprotons, pions, and protons at LAMPF II are suggested to investigate the mechanism of fragment formation.

3929 (LA—9798-P, pp 151) **Fragment emission in high-energy proton-nucleus interactions.** Porile, N.T. (Purdue Univ., Lafayette, IN). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Experiments to study the multifragment breakup of nuclei interacting with 1- to 15-GeV protons are described. The experiments consist of inclusive and semiexclusive counter studes as well as radiochemical studies.

3930 **Global test of modified precompound decay models.** Blann, M.; Vonach, H.K. (E-Division, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 4, 1475-1492(Oct 1983). Contract W-7405-ENG-48.

A single parameter set was adopted for the hybrid and geometry dependent hybrid models. The nuclear density profile was modified for consistency with results of the Myers nuclear droplet model. Optical model parameters were modified to give better global results for inverse reaction cross sections in the precompound energy range up to 90 MeV. Two types of multiple precompound decay processes are defined, and the more important of the two is incorporated into the precompound decay formalism. This results in two to five orders of magnitude improvement in predicting $^{202}$Hg(p,2p) and $^{202}$Hg(p,2pn) product yields for proton energies up to 86 MeV. The global parameter set and formulation of this work is compared with (n,xn) and (n,p) spectra for 14 MeV incident neutrons, for (p,n) spectra with 18—90 MeV protons, and with (p,p') spectra for 39—90 MeV protons. The geometry dependent hybrid model gives the better overall agreement, in most cases within the 20—30 % limit of significance attached to the model. Some discussion is given of methods by which the calculations might be further improved.

3931 **Electromagnetic properties of isomers in $^{210}$Pb.** Decman, D.J.; Becker, J.A.; Carlson, J.B.; Lanier, R.G.; Mann, L.G.; Struble, G.L.; Maier, K.H.; Stoeffl, W.; Sheline, R.K. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 3, 1060-1064(Sep 1983).

The lifetimes and magnetic moments of the J/sup $\pi$/ = $8^+$ and $6^+$ isomers in $^{210}$Pb have been measured using the gamma-ray perturbed angular distribution technique. The levels were populated with the $^{208}$Pb(t,p)$^{210}$Pb reaction. The g factors of the $8^+$ and $6^+$ states are found to be -0.312(8) and -0.312(15), respectively. The magnetic moment, $\mu$ = -1.42(7) $\mu$/sub N/, is deduced for the 2g(9/2) neutron orbital. Mean lifetimes are 290(25) ns for the $8^+$ state and 71(9) ns for the $6^+$ state. We find <g(9/2)parallelM(E2)parallelg(9/2)> = -39(2) e fm$^2$ and an effective charge of 0.88(5) e for the 2g(9/2) neutron orbital.

3932 **High-spin states in /sup 201,203/At and the systematic behavior of Z = 85 isotopes.** Dybdal, K.; Chapuran, T.; Fossan, D.B.; Piel, W.F. Jr.; Horn, D.; Warburton, E.K. (Department of Physics, State University of New York at Stony Brook, Stony Brook, New York 11794). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 3, 1171-1180(Sep 1983).

A spectroscopic investigation of high-spin states in /sup 201,203/At was performed by means of the reactions /sup 192,194/Pt($^{14}$N,5n)/sup 201,203/At with $^{14}$N energies between 85 and 100 MeV. In-beam measurements of $\gamma$-ray excitation functions, $\gamma$-$\gamma$ coincidences, $\gamma$-ray angular distributions, and pulsed-beam-$\gamma$ timing were made to determine the decay scheme, level energies, $\gamma$-ray multipolarities, spin-parity assignments, and isomeric lifetimes. The yrast and near-yrast level structures were established up to J~(25/2), and several isomers with mean lifetimes around 20 ns were observed. The systematic trends of level energies of the odd-mass astatine (Z = 85) isotopes are discussed in terms of proton-particle configurations of $^{211}_{85}At_{126}$ coupled to neutron-hole configurations of the corresponding even-mass lead isotones.

3933 **Observation of 2h$\omega$ hexadecapole strength in lead nuclei from 200 MeV inelastic proton scattering.** Tinsley, J.R.; McDaniels, D.K.; Lisantti, J.; Swenson, L.W.; Liljestrand, R.; Drake, D.M.; Bertrand, F.E.; Gross, E.E.; Horen, D.J.; Sjoreen, T.P. (University of Oregon, Eugene, Oregon 97403). *Physical Review* [*Section*] *C: Nuclear Physics;* **28**: No. 3, 1417-1420(Sep 1983).

Excitation of strength peaked at 12.0 MeV is observed in $^{208}$Pb and $^{206}$Pb via the inelastic scattering of 200 MeV protons. Based upon angular distribution measurements in $^{208}$Pb we interpret the strength as an isoscalar 2h$\omega$, L = 4, excitation.

3934 **Molecular alpha-particle clustering in $^{218}$Ra; dipole collectivity in the vicinity of nuclear shell closures.** Gai, M.; Ennls, J.F.; Ruscev, M.; Schloemer, E.C.; Shivakuma, B.; Sterbenz, S.M.; Tsoupas, N.; Bromley, D.A. (A. M. Wright Nuclear Structure Laboratory, Yale University, New Haven, Connecticut 06511). *Physical Review Letters;* **51**: No. 8, 646-649(22 Aug 1983). Contract AC02-76ER03074.

Evidence for the presence of alpha-particle clustering in $^{218}$Ra comes from a number of observables: binding energy S/sub 2n/, Q/sub $\alpha$/, E/sub x/(J/sup $\pi$/), $\theta$/sub $\alpha$/$^2$ and, F/sub $\alpha$/. That this clustering is a signature for the new dipole collectivity suggested by Iachello and Jackson follows from observation of simultaneous enhancement of selected E1, E2, and E3 deexcitation transition matrix elements; of these the E1 enhancement is most pronounced as would be expected for dipole collectivity.

3935 (CERN—83-02-Vol.2, pp 477-488) **Quark matter formation in high energy nucleus-nucleus collisions - predictions and observations.** Otterlund, I. (Lund Univ. (Sweden). Div. of Cosmic and Subatomic Physics). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

In this talk I give a short summary of the recent discussion around predictions and possible observations of quark-gluon plasma and fireballs in ultrarelativistic nucleus-nucleus collisions. In particular, this talk is focused on heavy ion reactions at 200 A GeV.

3936 **(JINR—E-4-82-694) Nonradiative excitation of the muonic atom $^{238}$U as an inverse conversion process.** Karpeshin, F.F.; Nesterenko, V.U. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 5p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704287.

The probabilities of nonradiative nuclear excitation are calculated for different muon transitions in the muonic atom $^{238}$U. Microscopic nuclear wave functions, obtained within the quasiparticle-phonon nuclear model, and the muonic conversion coefficients have been used. The probability of nonradiative nuclear excitation for the muonic transitions 2p → 1s and 3p → 1s has been found to be equal to 0.3. It is predicted that nonradiative E3 transitions 3d → 2p can take place with the probability 0.08-0.10. The dynamic effect of nuclear structure on the probability of nonradiative nuclear excitation is taken into account. The estimates of $^{238}$U fissility fission branching at nonradiation transitions are also obtained.

3937 **(JINR—R-7-82-638) Energy dependence of GITAsub(n)/GITAsub(f) partial widths ratio of neutron emission to fission for transuranium nuclei.** Il'inov, A.S.; Mebel', M.V.; Cherepanov, E.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1982. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704291.

To obtain information about the shell effect behaviour in nuclei depending upon the excitation energy from the experimental (HI, xn) reaction cross sections, partial width emission of neutrons

and partial width of fission ratio GITAsub(n)/GITAsub(f) for present excitation energy are analyzed. The energy behaviour value GITAsub(n)/GITAsub(f)(E*) in the excitation interval 7<=E*<=70MeV for $^{239}$Pu, $^{244}$Cm, $^{247}$Bk, $^{248}$Cf, $^{256}$Md, $^{258}$102 nuclei are studied. Two experimental values of GITAsub(n)/GITAsub(f)(E*) are compared with the calculated values under two assumptions: a) the shell effects in nuclei totally disappear; b) the shell effects in nuclei smoothly disappear with the increasing excitation energy. The shell effects in heavy transuranium nuclei attached to E*>=30MeV disappear. The liquid drop barriers of fission from high energy data are extracted and comparison with the liquid drop model is made.

3938 (LA—9798-P, pp 118-121) **Study of fission dynamics by muon-induced fission.** Oberacker, V.E. (Vanderbilt Univ., TN); Maruhn, J.A. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Prompt fission of $^{242}$Pu induced by internal conversion in muonic atoms is studied theoretically. We treat the fission mode classically in terms of an elongation and a mass asymmetry coordinate and solve the time-dependent Schroedinger equation for the muon in the Coulomb field of the fissioning nucleus by methods similar to those of time-dependent Hartree-Fock. The muon attachment to the light and heavy fission fragment is calculated as function of the friction coefficient and the fragment mass asymmetry.

3939 (LA—9798-P, pp 126-127) **Muon-induced fission.** Gavron, A. (Los Alamos National Lab., NM). Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

A short discussion of possible muon-induced fission experiments at LAMPF II is presented. A measurement of the attachment probability of the muon to the light fission fragment provides a measure of the time scale of the fission process.

3940 **Comment on "Determination of gamma-ray energies and abundances of $^{229}$Th".** Dickens, J.K. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 3, 1404-1406(Sep 1983). Contract W-7405-ENG-26.

It is shown that the absolute normalizaton of γ-ray yields (I/sub γ/) for transitions among levels in $^{225}$Ra following α decay of $^{229}$Th reported by Rattan et al. should be increased by at least 22%. Disagreements of reported values of I/sub γ/ with those in a recent report are discussed but not resolved.

3941 **Identification of $^{233}$Ac.** Chu, Y.Y.; Zhou, M.L. (Chemistry Department, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 3, 1379-1381(Sep 1983).

We report in this paper identification of the new isotope $^{233}$Ac. Uranium targets were irradiated with 28 GeV protons; after rapid retrieval of the target and separation of actinium from thorium, $^{233}$Ac was allowed to decay into the known $^{233}$Th daughter. Exhaustive chemical purification was employed to permit the identification of $^{233}$Th via its characteristic γ radiations. The half-life derived for $^{233}$Ac from several experiments is 2.3 +- 0.3 min. The production cross section for $^{233}$Ac is 100 μb.

3942 **Measurement of the /SUP 242m/ Am neutron fission cross section.** Dabbs, J.W.T.; Bemis, C.E.; Raman, S. (Oak Ridge National Laboratory, P.O. Box X, Oak Ridge, Tennessee 37830). *Nuclear Science and Engineering;* **84**: No. 1, 1-11(May 1983).

The fission cross section of /SUP 242m/ Am has been measured from 0.005 eV to 20 MeV using time-of-flight techniques at the Oak Ridge Electron Linear Accelerator. A hemispherical plate fission ionization chamber with five pairs of plates contained three deposits totaling 507 μg of /SUP 242m/ Am, one deposit of 168 μg $^{235}$U, and a "weightless" deposit of $^{252}$Cf, which served as a monitor of chamber performance. The fission of $^{235}$U, served as the cross-section standard for energies above 101 keV while $^{6}$Li(n,α), normalized to $^{235}$U fission in the 7.8- to 11.0-eV interval, served as a shape standard below 101 keV. Approximately 360 h of data were obtained at a flight path distance of 9.1 m, primarily with 40-ns bursts. Particular attention was paid to correction of backgrounds, especially inscattered-neutron-induced events. The fission resonance integral was found to be 1800 + or - 65 b.

3943 (CERN—83-02-Vol.2, pp 489-513) **States of matter in QCD.** Satz, H. (Bielefeld Univ. (Germany, F.R.). Fakultaet fuer Physik). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

We survey the thermodynamics of strongly interacting matter, as predicted by quantum chromodynamics. At low values of temperature and density, we find hadronic matter, while at high values the system becomes a primordial plasma of non-interacting massless quarks and gluons. Separating the two regimes is a transition region in which colour deconfinement and chiral symmetry restoration take place. We obtain preliminary values for the transition parameters and discuss the possibility of observing plasma formation in high energy heavy ion collisions.

3944 (CERN—83-02-Vol.2, pp 514-515) **Theoretical aspects of nucleus-nucleus collisions.** Hofe, L. van (European Organization for Nuclear Research, Geneva (Switzerland)). 10 Feb 1983. NTIS (US Sales Only), PC A23/MF A01. (CONF-821256—Vol.2).

From Workshop on SPS fixed-target physics in the years 1984-1989; Geneva, Switzerland (6 Dec 1982).

3945 **(IFUSP-P—301) Do spin and charge- exchange resonances possess a R(4)- symmetry.** Chen, C.H.T. (Sao Paulo Univ. (Brazil). Inst. de Fisica). Nov 1981. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704283.

It is suggested that spin- and charge-exchange resonances could be associated with a R(4) symmetry that should emerge from the consideration of these resonance states as those of many particle-hole phonons with various spin-isospin modes, taking a self-conjugate nucleus as our vaccum. Experimental results are compatible with the corresponding theoretical estimates.

3946 **(IFUSP-P—302) Multiple Coulomb excitation effects in heavy ion compound and fusion cross sections.** Carlson, B.V.; Hussein, M.S. (Sao Paulo Univ. (Brazil). Inst. de Fisica). Nov 1981. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704284.

A simple model for the average S-matrix that describes heavy ion direct processes in the presence of absorption due to compound nucleus formation is developed. The fluctuation cross section and the fusion cross section are then calculated for deformed heavy ion systems where multiple Coulomb excitation is important. A simple expression for the fusion cross section valid for above-barrier energies is then obtained. The formula clearly displays the modification due to Coulomb excitation in the usual geometrical expression.

3947 **(IFUSP-P—304) Energetics of the Gamow-Teller resonances.** Nakayama, K.; Galeao, A.P.N.R.; Krmpotic, F. (Sao Paulo Univ. (Brazil). Inst. de Fisica). Nov 1981. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704285.

It is suggested that the energy difference between the Gamow-Teller and Fermi resonances is given, in units of MeV, by E sub(GT) - E sub(F) = 26A sup(-1/3) - 18.5 (N-Z)/A. The consequences of this result on the strength of the spin and isospin dependent residual interaction, as well as on the effective axial-vector coupling constant, are discussed.

3948 **(IFUSP-P—313) Optical theorem and forward glory effects in heavy-ion scattering.** Hussein, M.S.; Nussenzveig, H.M.; Villari, A.C.C.; Cardoso Junior, J.L. (Sao Paulo Univ. (Brazil). Inst. de Fisica). Dec 1981. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704282.

A detailed discussion of the optical theorem for heavy-ion scattering is given. It is pointed out that a careful application of this theorem to light heavy-ion systems may yield information about the nuclear interaction at distances corresponding to forward glory trajectories. Applications to several cases are presented.

3949 (INIS-SU—180, pp 121-128) **Deep inelastic lepton-nuclear interactions.** Garsevanishvili, V.R.; Darbaidze, Ya.Z.; Menteshashvili, Z.R.; Ehsakiya, Sh.M. 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).
Portions are illegible in microfiche products7 refs.

The problem of building relativistic theory of nuclear reactions by way of involving relativistic methods, developed in the elementary particle theory, becomes rather actual at the time being. The paper presents some results of investigations into deep inelastic lepton-nuclear processes lA → l'(A-1)x, with the spectator nucleus-fragment in the finite state. To describe the reactions lA → l'(A-1)x (where l=an electron, muan, neutrino, antineutrino), the use is made of the self-similarity principle and multiparticle quasipotential formalism in the "light front" variables. The expressions are obtained for the differential cross-sections of lepton-nuclear processes and for the structure functions of deep inelastic scattering of neutrinos (antineutrinos) and charged leptons by nuclei.

3950 **(IPNO-TH—83-01) Remarkable properties of the broken pair model 2 relation with the quasi-particle scheme.** Lorazo, B.; Quesne, C. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Jan 1983. 26p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700004.

A non-spurious quasi-particle scheme is presented, its number-projection being exactly the broken-pair model. From this property, quantities needed in the broken-pair approach are easily evaluated by making use of the extreme simplicity of the quasi-particle algebra. Applications to the Hamiltonian operator and to one-body operators are presented for seniority v=0, 1 and 2.

3951 **(IPNO-TH—83-04) Nuclear excitations in the nuclear response theory.** Nguyen Van Giai. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1983. 29p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700065.

The Random Phase Approximation is used to calculate the response of a nucleus to an external field. The method allows a full treatment of continuum effects. Effective interactions to be used are discussed, and the consistency between the mean field and the residual interaction is stressed. Some applications to excitation properties of spherical nuclei are shown.

3952 **(JAERI-M—82-128) Comparisons of energy dependent point-wise cross-section generation codes: RESEND, RESENDD, RECENT.** Hasegawa, Akira; Narita, Tsutomu. (Japan Atomic Energy Research Inst., Tokyo). Sep 1982. 52p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE84700078.

In order to improve the current situation for production of group cross-section set, we performed intercomparison of energy dependent cross-section generation codes, i.e. RESEND, RESENDD and RECENT which are currently used in the nuclear data community. And also the results were contributed to the international comparisons of energy dependent cross-section generation codes, organized by Dr. Cullen of IAEA. The ENDF/B V dosimetry file (Vol 531 tape) is adopted as the common input data file. We calculated cold (i.e. 0.0 Kelvin) energy dependent point-wise cross-sections and also calculated unshielded group averages in the 620 group SAND-II structures for the convenience of comparisons. Through this assessment, we can not recommend to use the official version of RESEND code at all due to the erroneous cross-section generation for partial reaction cross-sections (other than total reaction) in the resolved resonance region and also for the cross-sections in the unresolved region. And for RESENDD code, it has problems following three points: 1) process error in the constant background cross section treatment in file-3 given by interpolation scheme 1, 2) insufficient data points generation in resolved resonance range for very narrow resonances, this affects resonance integrals by several tens percent overestimation for the worst case, 3) violating the process criteria in unresolved resonance range, in this range cross-sections other than the tabulated energies should be defined by interpolating the generated cross-sections at the tabulated energies (not the unresolved parameters). Hence, at present stage, we recommend to use RECENT code to generate energy dependent point-wise cross-sections.

3953 **(JINR—E-4-82-693) Short-range correlations in an extended time-dependent mean-field theory.** Madler, P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704286.

A generalization is performed of the time-dependent mean-field theory by an explicit inclusion of strong short-range correlations on a level of microscopic reversibility relating them to realistic nucleon-nucleon forces. Invoking a least action principle for correlated trial wave functions, equations of motion for the correlation functions and the single-particle model wave function are derived in lowest order of the FAHT cluster expansion. Higher order effects as well as long-range correlations are considered only to the extent to which they contribute to the mean field via a readjusted phenomenological effective two-body interaction. The corresponding correlated stationary problem is investigated and appropriate initial conditions to describe a heavy ion reaction are proposed. The single particle density matrix is evaluated.

3954 **(WIS-PH—83/21) Phenomenology of shape transitions in hot nuclei.** Levit, S.; Alhassid, Y.; Wright, A.W. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Nuclear Physics). May 1983. 64p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE84700069.

Phenomenological description of the temperature-driven shape transitions in heavy nuclei is presented. The general framework of the Landau theory is used to establish the free energy and entropy dependence on the deformation and the temperature-energy variables. This information is used to discuss the equilibrium quantities as well as the fluctuation effects around equilibrium shapes. Calculations are presented for the entropy, energy and the level density in the context of a typical example of a heavy nucleus undergoing shape transition. The results show considerable deviations from the standard dependences which are obtained using the assumption of a fixed nuclear shape.

3955 **(ZfK—498) Phase transitions in nuclear matter and consequences for neutron stars.** Kaempfer, B. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Apr 1983. 13p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700070.

Estimates of the minimal bombarding energy necessary to reach the quark gluon phase in heavy ion collisions are presented within a hydrodynamical scenario. Further, the consequences of first-order phase transitions from nuclear/neutron matter to pion-condensed matter or quark matter are discussed for neutron stars.

3956 **Predictions of the interacting boson approximation in a consistent Q framework.** Warner, D.D.; Casten, R.F. (Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 4, 1798-1806(Oct 1983). Contract AC02-76CH00016.

The predictions of the interacting boson approximation are studied in the consistent Q formalism in which the same parametrization of the boson quadrupole operator is used in both the Hamiltonian and in the E2 operator. In this scheme, wave functions, relative energies of states of the same spin, and all relative B(E2) values depend on only a single parameter, chi/sub Q/, which appears in the internal structure of the operator Q. This feature allows a number of simple results to be obtained, principally through the

construction of contour plots of various observables in terms of chi/sub Q/ and the boson number N. The entire SU(3)—O(6) region, including both limiting symmetries, can be treated by allowing chi/sub Q/ to vary between its respective limiting values for those two symmetries. For deformed nuclei, a number of characteristic features are obtained, involving the predicted decay of the $\gamma$ band and the energy and decay of the first $0^+$ excitation. It is shown that the dominance of the $\beta \rightarrow \gamma$ over $\beta \rightarrow g$ matrix elements and the near equality of $\beta \rightarrow \gamma$ and $\gamma \rightarrow g$ E2 matrix elements are inherent features of the model. The automatic inclusion of band mixing in the interacting boson approximation is discussed in terms of the mixing parameter Z/sub $\gamma$/ and it is shown that the interacting boson approximation reproduces the empirical systematics in Z/sub $\gamma$/. The concepts of the intrinsic state formalism are reviewed in the context of the consistent Q framework and shown to imply vanishing $\beta \rightarrow g$ transitions, for any boson number, in the absence of K mixing effects.

3957 **Effect of dissipation on the eigensolutions near the fission saddle point.** Davies, K.T.R.; Nix, J.R.; Sierk, A.J. (Physics Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] C: Nuclear Physics;* **28**: No. 3, 1181-1187(Sep 1983).

Two equivalent methods are developed for solving the problem of small oscillations near equilibrium when dissipative forces are included in the dynamical equations of motion. One method relies on the Lagrangian formulation of the equations of motion, and the other method relies on the Hamiltonian formulation. The eigenvalues are in general complex, but for unstable or overdamped motion they are purely real. We use the Lagrangian formulation to calculate the two lowest symmetric eigensolutions at the fission saddle point for nuclei with $Z^2/A$ ranging from 18.0 to 44.6 for ordinary two-body viscosity, one-body wall-formula dissipation, and one-body wall-and-window dissipation.

3958 **Calculations of pion excess in nuclei.** Friman, B.L.; Pandharipande, V.R.; Wiringa, R.B. (Department of Physics, University of Illinois at Urbana-Champaign, Urbana, Illinois 61801). *Physical Review Letters;* **51**: No. 9, 763-766(29 Aug 1983). Contract W-31-109-ENG-38.

The authors construct, in the static potential approximation, the number operator for excess pions present in nuclei due to the pion-exchange forces between nucleons. Expectation values are calculated with use of variational wave functions obtained from a realistic Hamiltonian. Results are presented for systems ranging from the deuteron to nuclear matter: For example $^{56}$Fe is estimated to have ~7 extra pions, over and above the pion clouds associated with the individual nucleons.

3959 **Nonlinear mean field theory for nuclear matter and surface properties.** Boguta, J. (Lawrence Berkely Lab., CA (USA)); Moszkowski, S.A. (California Univ., Los Angeles (USA)). *Nuclear Physics [Section] A;* **403**: No. 3, 445-468(25 Jul 1983).

Nuclear matter properties are studied in a nonlinear relativistic mean field theory. We determine the parameters of the model from bulk properties of symmetric nuclear matter and a reasonable value of the effective mass. In this work, we stress the nonrelativistic limit of the theory which is essentially equivalent to a Skyrme hamiltonian, and we show that most of the results can be obtained, to a good approximation, analytically. The strength of the required parameters is determined from the binding energy and density of nuclear matter and the effective nucleon mass. For realistic values of the parameters, the nonrelativistic approximation turns out to be quite satisfactory. Using reasonable values of the parameters, we can account for other key properties of nuclei, such as the spin-orbit coupling, surface energy, and diffuseness of the nuclear surface. Also the energy dependence of the nucleon-nucleus optical model is accounted for reasonably well except near the Fermi surface. It is found, in agreement with empirical results, that the Landau parameter $F_0$ is quite small in normal nuclear matter. Both density dependence and momentum dependence of the NN interaction, but especially the former, are important for nuclear saturation. The required scalar and vector coupling constants agree fairly well with those obtained from analyses of NN scattering phase shifts with one-boson-exchange models. The mean field theory provides a semiquantitative justification for the weak Skyrme interaction in odd states. The strength of the required nonlinear term is roughly consistent with that derived using a new version of the chiral mean field theory in which the vector mass as well as the nucleon mass is generated by the sigma-field.

3960 **Simplified equation of state near nuclear density.** Bethe, H.A. (California Inst. of Tech., Pasadena (USA). W.K. Kellogg Radiation Lab.); Brown, G.E.; Cooperstein, J. (State Univ. of New York, Stony Brook (USA). Dept. of Physics); Wilson, J.R. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). *Nuclear Physics [Section] A;* **403**: No. 3, 625-648(25 Jul 1983).

The equation of state near nuclear density influences shock formation in stellar collapse supernovae. The drop in the adiabatic index below 4/3 in this region, due to the negative nuclear pressure, disturbs the homology of the inner core and decreases its size. The initial shock energy and formation dynamics are particularly sensitive to matter in this regime. Only matter at low entropies ($S <= 1.5$) in the unshocked inner core approaches nuclear densities. We derive a simple equation of state for this material and find that nuclear properties are close to those at $S = 0$. The entropy associated with the nuclear surface can be absorbed into an 'effective mass' which decreases towards one with increasing density, giving an accurate accounting for the storage of entropy in the excitation of the large nuclei. Such thermal excitation drains energy with little contribution to the pressure and thus may have important effects on the launching of the shock. Two phase transitions are considered. The first, from the heavy nucleus to the 'bubble' phase, occurs at half nuclear matter density and is accomplished by use of simple expressions for the energy and pressure that include effects of the transition implicitly. The second, that to uniform nuclear matter, is done by requiring continuity of the pressure and entropy at the transition. The density at which this transition takes place is calculated and is found to decrease with entropy in a simple manner. With the use of suitable approximations, the equation of state is presented in a non-iterative form easily adapted for use in full hydrodynamical calculations of the supernovae process. Comparison with more detailed equations of state is made and the simplified one is found to represent well all important features.

3961 **Single-particle Glauber matrix elements.** Oset, E.; Strottman, D. (Departamento de Fisica Atomica y Nuclear, Universidad de Valladolid, Valladolid, Spain). *Atomic Data and Nuclear Data Tables;* **28**: No. 3, 531-555(May 1983).

The single-particle matrix elements of the Glauber profile function are tabulated for harmonic oscillator single-particle wave functions. The tables are presented in such a manner as to be applicable if the hadron—nucleon elementary scattering amplitude is specified by either a partial wave expansion or a Gaussian in momentum transfer squared. The table is complete through the 1 g/sub 9/2/ orbital and contains entries for the 3s/sub 1/2/ orbital for use if realistic wave functions are expanded in terms of harmonic oscillator functions.

3962 **Damping of nuclear excitations.** Bertsch, G.F.; Bortignon, P.F.; Broglia, R.A. (National Superconducting Cyclotron Laboratory and Department of Physics, Michigan State University, East Lansing, Michigan 48824). *Reviews of Modern Physics;* **55**: No. 1, 287-314(Jan 1983). Contract W-7405-ENG-26.

The authors review the theory and the empirical evidence of damping of simple nuclear excitations. The excitations considered are the particle states and vibrational states. The particle damping phenomena include the fragmentation of single-particle levels, the systematics of neutron strength functions, and the optical absorption of elastic scattering. Information on the known collective vibrational states is summarized and compared with theory. A theoretical model that has found considerable success is based on a damping mechanism in which the simple excitations mix with the surface vibrations. This implies that the surface damping dominates for excitation energies below about 15 MeV. There is a close relation between the single-particle damping and the damping of collective vibrations. However, the vibrational damping is strongly suppressed by the coherence between the particle and the hole. While

the model reproduces many of the observed features of the data rather well, it tends to underpredict the spreading width by as much as a factor of 2. Thus other degrees of freedom, not well understood at present, may play a role in the damping.

3963 **Path integral theory and deep inelastic scattering of nuclei.** Neto, J.L. Oxford, England; Oxford University (1981). 127p. Available from British Library, Boston Spa, Wetherby, West Yorks. No. D44229/83.

A formalism, based on Feynman's path integral, is developed and used in the theory of deep inelastic collisions of nuclei. Having shown how to express the propagator of the Wigner function of an isolated system as a (double) path integral in phase space, random processes are considered and the influence functional in interacting systems is discussed. A semi-classical description for the reduced Wigner and a generalized Langevin equation are given. Finally, the formalism is used in a random matrix model for deep inelastic collisions.

*REFER ALSO TO CITATION(S) 2863, 3566, 3976, 4141, 4171*

3964 **(AWRE—018/82) Calculation of the shielding effect of solid shell enclosures.** Garthwaite, F.G.L. (Ministry of Defence, Aldermaston (UK). Atomic Weapons Research Establishment). Apr 1983. 26p. HMSO, London, price Pound 1.50.

A computer code has been written to determine the shielding effect of solid-shell enclosures against EMP. It is based on the work of Kaden and Sevat. Kaden solved Maxwell's equations and derived the transfer functions for a sphere, a cylinder in an axial magnetic field and a cylinder in a transverse magnetic field. In most practical cases of shielding one of these basic shapes can be used. Sevat modified the transfer functions to allow the use of a computer and gave a set of curves which can be used to calculate the shielding effect of enclosures. For this program the shield characteristics (permeability and conductivity), the basic model and the dimensions of the model are all the data needed. A standard field pulse is incorporated in the model but the pulse parameters can be changed. Graphs of the external field pulse within the enclosure and the shielding efficiency are plotted by the program. Two sets of results are given, one for tinned iron shield and one for a copper shield, using a sphere to approximate the basic shape of the enclosures.

3965 **(EFI—514(1)-82) Phenomenon of the minimum of radiation energy losses of relativistic electrons in the crystal.** Avakyan, A.P.; Glebov, V.I.; Zhevago, N.K. Yan Shi. (Erevanskij Fizicheskij Inst. (USSR)). 1982. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703984.

A numerical solution is given of the problem on the integral radiation energy loss of relativistic electrons in the crystal in the approximation of the averaged potential of atomic chains (axes) taking into account all the crystal axes. The radiation energy loss of the electrons is found to take a minimum value when the electron inlet angle THETA$_0$ into the crystal with respect to axes tends to the critical Lindhard angle THETAsub(L)sup((S)) for axis channeling. This minimum is shown to be due to the fact that in the transition region from the axis channeling to the plane one, the fraction of particles accomplishing overbarrier motion and having noticeably less energy radiation loss, considerably increases.

3966 **(FEI—1282) Investigation of neutron kinetics in the nanosecond range in a depleted uranium sphere.** Romanov, V.M.; Makarov, O.I.; Matusevich, E.S.; Demenkov, V.G.; Zajtsev, M.Yu. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1982. 23p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700061.

Using a muniature pulsed ionization fission chamber employing a layer of $^{252}$Cf and positioned in the centre of a sphere, 20 cm in dia., of depleted uranium, and also a neutron scintillation spectrometer with an organic crystal, measurements were taken of the neutron flux density on the sphere surface as a function of time in the range of $5x10^{-9}$ s to $150x10^{-9}$ s for the energy ranging between 0.175 MeV and 10.5 MeV. The exponential drop in a limited time interval is shown to exist. The attenuation decrement in this case depends on the neutron threshold energy and varies from $8x10^{7}$ s$^{-1}$ to $3.2x10^{8}$ s$^{-1}$. The experimental results are compared with the calculation performed to a 26-group diffusion approximation.

3967 **(IAE—3468/6) Distributions of accelerated ion ranges. Helium and lithium isotopes.** Burenkov, A.F.; Zhukova, T.I.; Komarov, F.F.; Kumakhov, M.A.; Temkin, M.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1981. 60p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83703986.

The calculation results of distribution profiles, elastic and inelastic losses of $^{3}$He, $^{4}$He, $^{6}$Li, $^{7}$Li ions in thirteen metallic targets and silicon are presented.

3968 **(JAERI-M—82-118) Data on trapping and re-emission of energetic hydrogen isotopes and helium in materials.** Yamaguchi, Sadae; Sugizaki, Yasuaki; Ozawa, Kunio; Nakai, Yohta. (Japan Atomic Energy Research Inst., Tokyo). Aug 1982. 77p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE84700010.

This report presents a compilation of the experimental data on trapping and re-emission of energetic hydrogen isotopes and helium in materials. A survey has been made of the literatures up to end of 1980, by dividing it into following seven sections: 1) Dose Dependence, 2) Target Material Dependence, 3) Time Dependence, 4) Target Temperature Dependence, 5) Incident Energy Dependence, 6) Damage Effects, 7) Ion-Induced Release. The experimental data for helium, however, is cited only in limited cases, because of the lack of experiments.

3969 **(JAERI-M—82-130) Benchmark experiment on D-T neutrons and secondary gamma rays streaming through a concrete bent duct.** Tanaka, Shun-ichi; Oyama, Yukio; Sasamoto, Nobuo; Nakamura, Tomoo. (Japan Atomic Energy Research Inst., Tokyo). Sep 1982. 45p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700062.

A streaming experiment was carried out to examine the behavior of D-T neutrons and secondary gamma rays in a concrete bent duct constructed as a personnel access way in the Fusion Neutronics Source Facility (FNS). The distributions in the duct were measured for neutron and gamma-ray dose equivalents, fast neutron dose, and thermal neutron flux. The energy spectra of fast neutrons and gamma rays were also measured at four positions in the duct. This report describes in detail the experimental technique, the measured data as well as the experimental conditions such as the configuration and the composition of the structural materials and the source conditions which are essential for the analysis of the measurements.

3970 (LA—9798-P, pp 401-402) **$K^+/\mu^+$, $\pi^+/\mu^+$, and $\mu^+/e^+$ lattice steering in highly perfect crystals.** Maier, K. (Universitaet Stuttgart, Germany); Seeger, A. Jun 1983. NTIS, PC A19/MF A01.

In Physics with LAMPF II.

Lattice-steering (channeling) experiments, involving the implantation of positive kaons, pions, or muons, allow the determination of the crystal site preferred by the implanted particle. Interstitial electrostatic potentials and light interstitial diffusion information can therefore be obtained. LAMPF II could provide an excellent source of these particles for studies of considerable interest to materials science.

3971 **(SAND—83-1409C) Radiation-enhanced diffusion in ion-implanted glasses and glass/metal couples.** Arnold, G.W. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 6p. (CONF-831174—8). NTIS, PC A02/MF A01. Order Number DE84002802.

From Materials Research Society annual meeting; Boston, MA, USA (14 Nov 1983).

Ion implantation causes alkali migration to the surface in alkali silicate glasses. Rutherford backscattering spectrometry was used to follow this depletion. Room temperature implantations of 5 x $10^{16}$ 250 keV Xe/$cm^2$ in $12M_2O.88SiO_2$ (M = Li, Na, K, Rb, Cs) removes approximately equal numbers (within a factor of 2) of alkali from the glass. Low temperature (77K) implants significantly reduce the alkali loss. These results imply a radiation-enhanced diffusion mechanism in which the alkali interchanges with the products of the collision cascade, with the kinetics being limited by the radiation damage components. The results for mixed-alkali glasses ($(12-x)M_2O.xCs_20.88SiO_2$) give further evidence for this process. In glass/metal couples, radiation enhanced diffusion allows the interchange of glass network components with deposited metals. Rutherford backscattering spectrometry was used to follow the interchange of silicate and phosphate glass components with metal ions near the heavy-ion implanted interface between glass substrate and metal (Al,Zr) films.

3972 **Recent muon fluence measurements at Fermilab.** Cossairt, J.D. (Fermilab, Batavia, IL). *Health Physics;* **45**: No. 3, 651-658(Sep 1983).

Muon fields at Fermilab were measured during 1980-1981 using a Mobile Environmental Radiation Laboratory (MERL). During the spring of 1980, measurements were made with the accelerator operating at 350 GeV; in the spring of 1981, measurements were made at 400 GeV. The measurements were used to obtain an understanding of muon dose-equivalent rates at various locations both on and off the Fermilab site. These were found to be less than 1 mrem/yr at any given location. The data indicate that more severe problems may be encountered during operations of the 1000 GeV accelerator presently being installed.

3973 **Position-dependent stopping power for channeled ions.** Crawford, O.H.; Nestor, C.W. Jr. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] A: General Physics;* **28**: No. 3, 1260-1266(Sep 1983). Contract W-7405-ENG-26.

A method is developed for predicting the stopping power of crystals toward swift channeled ions, based on a semiempirical treatment of the dielectric response of the medium. Random stopping power is also obtained. Theoretical results are compared with the experimental channeled stopping power of gold as a function of ion velocity and position within channels. It is shown that the theory is accurate when the velocity of the ion equals at least twice the root-mean-square velocity (estimated from binding energies) of most of the electrons near its path.

3974 **Time-dependent scattering in resonance lines.** Kunasz, P.B. (Lawrence Livermore National Laboratory). *Astrophysical Journal;* **271**: No. 1, 321-334(1 Aug 1983).

A numerical finite-difference method is presented for the problem of time-dependent line transfer in a finite slab in which material density is sufficiently low that the time of flight between scatterings greatly exceeds the relaxation time of the upper state of the scattering transition. The medium is assumed to scatter photons isotropically, with complete frequency redistribution. Numerical solutions are presented for a homogeneous, time-independent slab illuminated by an externally imposed radiation field which enters the slab at t = 0. Graphical results illustrate relaxation to steady state of trapped internal radiation, emergent energy, and emergent profiles. A review of the literature is also given in which the time-dependent line transfer problem is discussed in the context of recent analytical work.

3975 **Inelastic neutron scattering studies of some intramolecular hydrogen bonded complexes: A new correlation of γ(OHO) vs R (OO).** Howard, J.; Tomkinson, J.; Eckert, J.; Goldstone, J.A.; Taylor, A.D. (University of Durham, Chemistry Department, Durham DH1 3LE, United Kingdom). *Journal of Chemical Physics;* **78**: No. 6, 3150-3155(15 Mar 1983).

Inelastic neutron scattering spectra of several complexes {potassium hydrogen maleate, nickel dimethylglyoxime, and tripotassium cis-dichloro (hydrogen disulfito) and tripotassium cis-dichloro (hydrogen disulfito) platinate (II)} with strong intramolecular hydrogen bonds have been obtained and the out-of-plane bending modes γ(OHO) of the hydrogen bond assigned. Using previously published data, primarily for intermolecularly hydrogen bonded complexes, it is shown that as the oxygen—oxgyen distance {R(OO)} decreases γ(OHO) increases. Our new data do not follow this correlation since γ(OHO) is also observed to decrease as R(OO) decreases. It is suggested that this observation is due not to a fundamental difference in the behavior of inter- and intramolecular hydrogen bonds but rather to the different range of values of R(OO) found for each type. For the intermolecular systems R(OO) is greater than ~ 2.44 A, while for the intramolecular complexes (including potassium monochloromaleate) R(OO) is less than this value. It appears that hydrogen bonds undergo a change in dynamic properties at R(OO) 2.44 A and some geometric properties of ring systems are discussed which support this idea.

3976 **Mathematical problems in kinetic theory: Oberwolfach Conference, 22—26 November 1982.** Greenberg, W.; Zweifel, P.F. (Laboratory for Transport Theory and Statistical Physics, Virginia Polytechnic Institute and State University, Blacksburg, Virginia 24061). *Transport Theory and Statistical Physics;* **12**: No. 1, 85-101(Jan 1983). Contract AS05-80ER10711.

A review of reports presented at the third Oberwolfach Conference is given. Existence proofs of solutions to the nonlinear Boltzmann equation drew the most attention. Also discussed were chaotic systems and the Vlasov problem. (AIP)

3977 **Ion channeling techniques for defect and surface studies.** Appleton, B.R. (Oak Ridge National Lab., TN). pp 97-115 of Defects in semiconductors. Narayan; Tan (eds.). Amsterdam, Netherlands; North-Holland, Inc. (1981). Contract W-7405-ENG-26.

The channeling and blocking phenomena are well enough understood that they can be combined with ion scattering or ion induced reactions to investigate defects and surface structures. A brief review is given of the origins of these phenomena, of associated concepts which are useful for defect and surface analysis, and of experimental constraints and requirements. Applications to selected problems are used to illustrate the advantages and limitations of these techniques.

3978 **Calculation of stray dose distributions of gamma and X radiation in homogeneous and inhomogeneous media by means of Monte-Carlo methods.** Sadat-Khonsari, A. Berlin, Germany; Freie University (1981). 89p. (In German). Available from the library of Freie Univ. Berlin (Germany, F.R.).

The dose distributions for photon radiations up to 1.25 MeV may be determined accounting for the photoelectric and the Compton effect alone. The calculations were made for discrete energy values between 50 keV and 1.25 MeV for a water-equivalent half space. For determination of the influence of the scattering medium on the stray dose distribution the Monte-Carlo calculation was performed for Al as the absorbing medium.

3979 **(GSF-S—885) Calculation of dose from external photon exposures using reference human phantoms and Monte-Carlo methods. Pt. 1.** Kramer, R.; Zankl, M.; Williams, G.; Drexler, G. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.)). Dec 1982. 75p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE83751351.

By the help of a Monte-Carlo program the dose that single organs, organ groups and bigger or smaller parts of body would receive on an average, caused by an irradiation definitely fixed by the geometry of irradiation and photon energy, can be determined. Thus the phantom in connection with the Monte-Carlo program can be used for several considerations as for example - calculation of dose from occupational exposures - calculation of dose from diagnostic procedures - calculation of dose from radiotherapy procedures.

3980 **(ORNL/TM—8697) 1982 US-CEC neutron personnel dosimetry intercomparison study.** Swaja, R.E.; Sims, C.S.; Greene, R.T.; Schraube, H.; Burger, G. (Oak Ridge National Lab., TN (USA)). Nov 1983. Contract W-7405-ENG-26. 78p. NTIS, PC A05/MF A01. Order Number DE84002975.

A neutron personnel dosimetry intercomparison study was conducted during April 19-23, 1982, as a joint effort between the United States and the Commission of European Communities. Dosimeters from 48 participating agencies were mounted on cylindrical phantoms and exposed to a range of low-level dose equivalents (0.48-13.91 mSv neutron and 0.02-1.32 mSv gamma) in nine different radiation fields. Exposure conditions considered in this study included four mixed-field spectra produced using the Health Physics Research Reactor, four monoenergetic neutron fields generated by accelerators, and one 15-cm $D_2O$-moderated californium source spectrum. In general, neutron results reported by the participating agencies were consistent with expected dosimeter performance based on energy response characteristics of the detection systems. Albedo dosimeters, which were the most popular neutron monitoring systems used in this study, provided the best overall accuracy for all exposure conditions. Film, Cr-39 recoil track, and Th-232 fission track systems generally underestimated dose equivalents relative to reference values. Associated gamma measurements showed that TLD monitors produced more accurate results than film dosimeters although both systems overestimated gamma dose equivalents in mixed radiation fields. 24 references, 10 figures, 19 tables.

3981 **(UCRL—88041) Beta-dosimetry studies at LLNL.** Hankins, D.E. (Lawrence Livermore National Lab., CA (USA)). 1983. Contract W-7405-ENG-48. 21p. (CONF-830204—13). NTIS, PC A02/MF A01. Order Number DE84002792.

From International beta dosimetry symposium; Washington, DC, USA (15 Feb 1983).

Portions are illegible in microfiche products.

This paper summarizes three beta-dosimetry studies made recently at the Lawrence Livermore National Laboratory. The first study was to determine the beta-gamma exposure rates at the Los Alamos Godiva IV Critical Assembly. The beta spectra from the assembly were evaluated using absorption curves and the beta-gamma dose-rate ratios were determined at various distances from the assembly. A comparison was made of the doses determined using two types of TLD personnel dosimeters and a film badge. The readings of an Eberline RO-7 instrument and the dose rates determined by TLDs were compared. Shielding provided by various metals, gloves, and clothing were measured. The second study was to determine the beta energy response of the Eberline RO-7 instrument based on measurements made with the PTB beta sources. This study required additional calibration points for the PTB sources which were made using extrapolation chamber measurements. The third study resulted in two techniques to determine the beta energy (E/sub max/) from the readings of this-window portable survey instruments. Both techniques are based on the readings obtained using aluminium filters. One technique is for field application, requires one filter, and provides a quick estimate of the beta energy in three energy groups: $<$ 0.5 MeV, 0.5 MeV to 1.5 MeV and $>$ 1.5 MeV. The second technique is more complex requiring measurements with two or three filters, but gives the beta energy and the approximate shape of the beta spectrum. 9 references, 6 figures.

3982 **Activation of the major constituents of tissue and air by a fast neutron radiation therapy beam.** Ten Haken, R.K.; Awschalom, M.; Rosenberg, I. (Fermilab Neutron Therapy Facility, Batavia, Illinois 60510). *Medical Physics;* **10**: No. 5, 636-641(Sep 1983).

The production of $^{11}C$, $^{13}N$, $^{15}O$ from C, N, O, and of $^{39}Cl$ and $^{41}Ar$ from Ar by a p(66)Be(49) clinical neutron therapy beam has been measured. The results of these measurements were used to estimate the production of other radionuclides, then to estimate airborne radioactivity in a typical neutron therapy room and radioactivity induced in body tissues during treatment. Only under special circumstances would airborne radioactivity necessitate a waiting period before entering a typical treatment room. The additional dose to a treatment volume due to decay products from radioactivity induced within that volume would amount to a few thousandths of the given dose and the additional body dose outside the treated volume would be a few millionths of the given dose.

3983 **American National Standard: neutron and gamma-ray flux-to-dose rate factors.** La Grange Park, IL; American Nuclear Society (1977). 15p. (ANSI/ANS—6.1.1-1977). American Nuclear Society, 555 North Kensington Avenue, La Grange Park, IL 60525 $12.00.

This Standard presents data recommended for computing biological dose rates due to neutron and gamma-ray radiation fields. Neutron flux-to-dose-rate conversion factors for energies from 2.5 x $10^{-8}$ to 20 MeV are given; the energy range for the gamma-ray conversion factors is 0.01 to 15 MeV. Specifically, this Standard is intended for use by shield designers to calculate wholebody dose rates to radiation workers and the general public. Establishing dose-rate limits is outside the scope of this Standard. Use of this Standard in cases where the dose equivalents are far in excess of occupational exposure guidelines is not recommended.

From 1. Latin-American colloquium of surface physics; Niteroi, Brazil (1 Dec 1980).

Several physical properties are discussed, reviewed and presented from studies in metal, liquid and solid surfaces. The adsorption effect is studied for a series of experimental and theoretical configurations. Experimental devices are also shown.

3985 (INIS-BR—79, pp 33-44) **Single atom and-molecules chemisorption on solid surfaces.** Anda, E.V.; Ure, J.E.; Majlis, N. (Universidade Federal Fluminense, Niteroi (Brazil). Inst. de Fisica). Oct 1981. (In Portuguese). NTIS (US Sales Only), PC A11/MF A01. (CONF-8012117—).

From 1. Latin-American colloquium of surface physics; Niteroi, Brazil (1 Dec 1980).

A simplified model for the microscopic interpretation of single atom and molecules chemisorption on metallic surfaces is presented. An appropriated hamiltonian for this problem is resolved, through the Green's function formalism. (L.C.).

3986 (INIS-BR—79, pp 71-74) **Analysis of the phonon surface specific heat using Green function techniques.** Silva Carrico, A. da; Albuquerque, E.L. de (Rio Grande do Norte Univ., Natal (Brazil). Dept. de Fisica). Oct 1981. NTIS (US Sales Only), PC A11/MF A01. (CONF-8012117—).

From 1. Latin-American colloquium of surface physics; Niteroi, Brazil (1 Dec 1980).

Green functions are derived for the displacement associated with acoustic vibrations in isotropic elastic media and used to evaluate the surface specific heat in the harmonic approximation. Only the low-temperature limit case is considered since, provided K sub(B) T/h is very small, the dispersion relation for the three acoustic branches can be replaced by its long-wavelenght form. The contributions of surface elastic waves of the Rayleigh and Love types are pointed out and their features discussed. The nature of the result and their relations to previous work in this field is also presented and discussed.

3987 (INIS-BR—79, pp 223) **Brillouin scattering theory by bending in rough surfaces.** Khater, A.F. (Universidade Federal Fluminense, Niteroi (Brazil). Inst. de Fisica). Oct 1981. (In Portuguese). NTIS (US Sales Only), PC A11/MF A01. (CONF-8012117—).

3989 (INIS-BR—79, pp 183-186) **Light scattering by surface phonons in crystals.** Albuquerque, E.L. de (Rio Grande do Norte Univ., Natal (Brazil). Dept. de Fisica Teorica e Experimental). Oct 1981. NTIS (US Sales Only), PC A11/MF A01. (CONF-8012117—).

From 1. Latin-American colloquium of surface physics; Niteroi, Brazil (1 Dec 1980).

A theory of inelastic light scattering by surface acoustic phonons in homogeneous crystals is presented. The Green functions are determined by the use of a classical linear response method and used to evaluate the Brillouin cross section. The acoustic modes are found from solutions to the acoustical-wave equation and boundary conditions appropriated. Two light-scattering mechanisms, namely the surface corrugation and bulk elasto-optic effect are analyzed by deriving optical fields which satisfy both the acousto-optically driven wave equation and the electromagnetic boundary conditions. No restrictions are imposed concerning the angle of incidence of the light. Some representative computed Brillouin lineshapes are also presented and their features discussed.

3990 (INIS-mf—7727, pp 40-45) **Mechanism of piezo - and pyroelectricity of poly (vinylidene fluoride) electret.** Wada, Y. (Tokyo Univ. (Japan). Faculty of Engineering). Oct 1980. NTIS (US Sales Only), PC A16/MF A01. (CONF-8010267—).

From 2. Japan-Brasil symposium on science and technology; Rio de Janeiro, Brazil (13 Oct 1980).

Basic concepts of the piezo - and pyroelectricity theory of polymer electrets are given. The origins of these effects are presented. The piezo - and pyroelectric constants are numerically obtained.

3991 **Nonlinear saturation of Rayleigh—Taylor instability in thin films.** Babchin, A.J.; Frenkel, A.L.; Levich, B.G.; Sivashinsky, G.I. (Institute of Applied Chemical Physics, The City College of The City University of New York, New York, New York 10031). *Physics of Fluids;* **26**: No. 11, 3159-3161(Nov 1983). Contract AC02-80ER10559.

A general mechanism of nonlinear saturation of instabiities in flowing films is described using the Rayleigh—Taylor instability as an example. The combined action of flow shear and surface tension is the essence of the saturation mechanism. As a result, the streamwise perturbations of the interface that would rupture a stagnant film do not rupture a film flowing in a certain range of shear rates.

3992 **Floating phase in the chiral Potts model. A Monte Carlo renormalization-group analysis.** Houlrik, J.M.; Jensen, S.J.K.; Bak, P. (Department of Physical Chemistry, Chemical Institute, Aarhus University, Aarhus, Denmark). *Physical Review* [*Section*] *B: Condensed Matter;* **28**: No. 5, 2883-2885(1 Sep 1983). Contract AC02-76CH00016.

Layers of atoms or molecules adsorbed on surfaces may exhibit floating critical phases. To investigate this phenomenon we have developed a Monte Carlo renormalization-group scheme and performed calculations on the three-state chiral clock model. The results indicate a continuous transition from a floating phase to a liquid phase at a temperature much higher than that found by series-expansion methods.

3993 **Monte Carlo simulation study of the two-dimensional melting mechanism.** Allen, M.P.; Frenkel, D.; Gignac, W.; McTague, J.P. (Department of Chemistry, University of California, Los Angeles, California 90024). *Journal of Chemical Physics;* **78**: No. 6, 4206-4222(15 Mar 1983).

We report here a Monte Carlo study of the thermodynamic and structural properties of a two-dimensional system of 2500 particles interacting by a repulsive inverse sixth power potential. Particular effort was made in the melting region, both to identify the defect structures and to ascertain the thermodynamic changes associated with the transition. Significant precursor fluctuations occurred on both the solid and fluid sides, and the unbinding of dislocation pairs was observed on melting. More complex defect patterns, including grain boundary loops, were also generated near melting. The Kosterlitz—Thouless, Halperin—Nelson, and Young dimensionless elastic constant approached the universal value $16\pi$ in the solid, and the orientational correlation range tended to diverge in the fluid near freezing. However, we were unable to distinguish between a very weak ($\Delta V/V \approx 0.7\%$) first order and a continuous transition, since both spatial structures and temporal relaxations became exceedingly long.

3994 **Surface contribution to the optical properties of nonlocal systems.** Mochan, W.L.; Fuchs, R.; Barrera, R.G. (Ames Laboratory—U.S. Department of Energy, Ames, Iowa 50011 and Department of Physics, Iowa State University, Ames, Iowa 50011). *Physical Review* [*Section*] *B: Condensed Matter;* **27**: No. 2, 771-780(15 Jan 1983).

A simple formalism is developed for the calculation of the optical properties of a nonlocal system, treating the continuous change of its response functions near the surface as a perturbation. The surface impedance is obtained in terms of the surface impedance of the unperturbed system and of the surface conductivity. The results are very general since no assumption about the unperturbed system is made, and it is shown that they include those of previous theories.

3995 **Chaos, periodic chaos, and the random-walk problem.** Kozak, J.J.; Musho, M.K.; Hatlee, M.D. (Department of Chemistry and Radiation Laboratory, University of Notre Dame, Notre Dame, Indiana 46556). *Physical Review Letters;* **49**: No. 25, 1801-1804(20 Dec 1982).

The authors have studied whether numerically generated sequences from the logistic parabola f/sub b/(x) = 4bx(1-x) with b,xε[0,1], for values of b above the Feigenbaum critical value b/sub infinity/, are truly chaotic or whether they are periodic but with exceedingly large periods and very long transients. Using the logistic parabola the authors calculate via Monte Carlo simulation the average walk length for trapping on a one-dimensional lattice with a centrosymmetric trap. Comparison with exact results suggests that the only "truly chaotic" sequence is the one for which b = 1.

3996 **Resonance and pairing effects in the Anderson lattice.** Fedro, A.J. (Northern Illinois Univ., DeKalb); Sinha, S.K. pp 371-374 of Valence instabilities. Wachter, P.; Boppart, H. (eds.). New York, NY; North-Holland Publishing Company (1982).

We have calculated the one electron Green's functions for the Anderson lattice beyond Hubbard I by considering the equation of motion for the spin fluctuations arising from the large ($U = \infty$) correlation energy in a manner formally equivalent to that of Nagaoka in the Kondo impurity problem. This leads directly to frequency dependent self energy corrections yielding lifetime effects and, more importantly, a resonance in the f density of states at the Fermi energy, $\mu$, resulting in heavy Fermi liquid behavior for states near $\mu$, regardless of the position of the f level. In addition, at low temperatures, we find the formation of a highly coherent state, driven by the correlations, in which the f and conduction electrons undergo singlet pairing resulting in anomalies in specific heat and susceptibility.

3997 **Computer simulation of crack propagation: lattice trapping.** Paskin, A. (City Univ. of New York, Flushing); Som, D.K.; Dienes, G.J. *Journal of Physics C: Solid State Physics;* **14**: L171-L176(1981). Contract AC02-76CH00016.

Lattice trapping is an unexpected result obtained in a number of atomistic treatments of crack propagation. Molecular dynamic simulation was used in the present investigation to study crack behaviour. Using a large two-dimensional sample of about 11000 atoms and a relatively long-range Lennard-Jones potential,

lattice trapping is found to be a negligible effect. Sample size effects and the non-linearity of the modulus were studied and found not to affect the lattice trapping result. Negligible lattice trapping seems to be a consequence of the range of the potential; long-range continuous potentials produce negligible lattice trapping.

3998 **An estimate of the surface roughness effect.** Borie, B. (Oak Ridge National Lab., TN). *Journal of Applied Crystallography;* **14**: 219-222(1981). Contract W-7405-ENG-26.

A method for the computation of the effect of rough sample surfaces on diffraction intensities is described. Though the model used for the calculation is a special simple one, it is exact. The method is illustrated by its application to a surface whose boundary is a saw-tooth. Possible generalizations of the character of the surface roughness effect and how it depends on the dimensions of the surface irregularities are inferred from the calculation.

3999 **Chemical potentials in solids.** Nolfi, F.V. Jr. (Argonne National Lab., IL). *Scripta Metallurgica;* **14**: No. 12, 1323-1330(1980).

The purposes of this paper are: a) to provide a fundamental thermodynamic description of solids acted upon by nonhydrostatic and nonhomogeneous stresses, and b) to develop a self-consistent method of accounting for strain and volume changes in solids. Both amorphous and crystalline solids are considered in this paper.

## 6561 Superconductivity

4000 **(JINR—E-17-82-240) Microscopic model for superconductor with normal state nuclei.** Shumovsky, A.S.; Yukalov, V.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 6p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704004.

The microscopic model for two-liquid state in superconductors is constructed. It is shown that the existence of the stable normal component below the critical point is due to the competition between the effective attraction and Coulomb repulsion of electrons. The possibility of the nucleation phenomenon at the nonzero temperatures and the existence of a jump of the specific heat in the nucleation point are predicted. For the strong Coulomb repulsion the system is not purely superconducting even in the ground state.

4001 **Symmetry considerations for H/sub c/2 anisotropy experiments in cubic superconductors.** Sauerzopf, F.M.; Seidl, E.; Weber, H.W. (Atominstitut der Osterreichischen Universitaeten, Vienna, Austria). *Journal of Low Temperature Physics;* **49**: No. 3, 251-266(1 Nov 1982).

We report on an evaluation of H/sub c/2 anisotropy effects in arbitrary planes and directions of cubic superconductors. Using Mercator projections, information on the three-dimensional variation of H/sub c/2 is obtained. The results are discussed for the three main crystallographic planes of the cubic lattice and evaluated in terms of their usefulness for an accurate experimental determination of the anisotropy coefficients A/sub 1/. Although some planes show interesting features because of special symmetry conditions, we conclude that careful measurements in the (110) plane represents the optimum choice for an accurate determination of the anisotropy coefficients.

## 6570 Theoretical Physics

*REFER ALSO TO CITATION(S) 3118, 3476, 3845, 3987, 4034*

4002 **(CEA-CONF—6634) Sturm-Liouville spectrum problem: quartic oscillator case.** Voros, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Nov 1982. 10p. (In French). (CONF-8211123—1). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700001.

From Bourbaki seminar; Paris, France (20 Nov 1982).

The Sturm-Liouville eigenvalue problem given by the steady-state Schroedinger equation in quantum mechanics is considered on the real axis. There are, however, exact expressions available only for a harmonic oscillator (the Hermite equation); consequently, semi-classical asymptotic methods (in powers of the Planck's constant), which yield very good approximations, have been much studied analytically and as regards their relationships to geometrical optics. These methods relate the asymptotic form of the spectrum to the closed orbits of the Hamiltonian vector field of the function $H(p,q) = p^2 + V(q)$ in the phase space $R^2$. We seek to show that these supposedly approximate methods are in fact an exact way of solving the problem. The quartic oscillator, with $V(q) = q^4$, is used as an example.

4003 **(DOE/ER/03992—529) Fourier optics for the Maxwell field: formalism and applications.** Mukunda, N.; Simon, R.; Sudarshan, E.C.G. (Indian Inst. of Science, Bangalore. Centre for Theoretical Studies; Texas Univ., Austin (USA). Center for Particle Theory; Indian Inst. of Science, Bangalore. Dept. of Physics). Sep 1983. Contract AS05-76ER03992. 30p. NTIS, PC A03/MF A01. Order Number DE84002845.

The basic formalism for first order paraxial Fourier optics of the Maxwell field is established. Analysis of the relativistic symmetry of Maxwell's equations leads to specific mathematical quantities using which the passage from scalar to vector Fourier optics becomes unambiguous. The inconsistency of viewing scalar Fourier optics as the description of plane polarized Maxwell waves is recognized. System operators giving the actions of lenses, magnifiers, Fourier transformers and general first order systems on Maxwellian waves are constructed. Both field strength and vector potential treatments are given. Propagation of Gaussian beams is studied as an example. 20 references.

4004 **(DOE/ER/03992—530) Generalized rays in first order optics: transformation properties of Gaussian Schell-model fields.** Simon, R.; Sudarshan, E.C.G.; Mukunda, N. (Indian Inst. of Science, Bangalore. Centre for Theoretical Studies; Texas Univ., Austin (USA). Center for Particle Theory; Indian Inst. of Science, Bangalore. Dept. of Physics). Sep 1983. Contract AS05-76ER03992. 15p. NTIS, PC A02/MF A01. Order Number DE84002844.

Propagation characteristics of Gaussian Schell model fields through first order optical systems and in free space are analyzed by the method of generalized rays. This allows the development of a simple geometrical description of these processes. The invariance of the degree of global coherence is established in full generality. Asymptotic behavior under free propagation and the emergence of a far zone universal structure are analyzed. New invariants associated with incoherent superpositions of such fields are found. 19 references.

4005 **(DOE/ER/03992—531) Realization of first order optical systems using thin lenses.** Sudarshan, E.C.G.; Mukunda, N.; Simon, R. (Texas Univ., Austin (USA). Center for Particle Theory; Indian Inst. of Science, Bangalore. Centre for Theoretical Studies; Indian Inst. of Science, Bangalore. Dept. of Physics). Sep 1983. Contract AS05-76ER03992. 18p. NTIS, PC A02/MF A01. Order Number DE84002848.

A first order optical system is investigated in full generality within the context of wave optics. We reduce the problem to a study of the ray transfer matrices. The simplest such systems correspond to axially symmetric propagation. Realization of such systems by centrally located lenses separated by finite distances is studied. It is shown that every axially symmetric first order system can be realized using at most three lenses. Among anisotropic systems it is proven that every symplectic ray transfer matrix, and no others, can be realized using lenses and free propagations. Suggestions for further study of the general first order system are outlined. 16 references.

4006 **(FEI—1308) Construction of Green functions by the additive operator splitting method.** Yuferov, A.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1982. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700002.

The construction of the Green functions by the additive splitting of operators is described. Examples of the Green function construction for evolution and one-velocity kinetic equations are given. The results obtained are the detailing and generalization of the known perturbation theory results of higher orders. However, here underlined is their applicability as universal means for the construction of the inverse operators - Green functions, but not only as means for determining corrections as this is interpreted in the perturbation theory.

4007 **(IAE—3611/12) To the theory of non-adiabatic transitions between degenerated states.** Likhanskij, V.V.; Solodovnikov, G.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1982. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700003.

Non-adiabatic transitions between degenerated states in a model of crossing of a parallel level system with one term were considered. Populations of sublevels in the finite state are completely determined with matrices of transitions between degenerated levels and phases of phi functions of the initial state. Expressions for transition probabilities averaged from random phases of the phi functions of the initial degenerated state have been obtained. Numerical calculations performed confirm completely analytical results in the given work.

4008 **(IFVE-OTF—82-56) Heisenberg operators of generalized Toda lattice.** Fedoseev, I.A.; Leznov, A.N.; Saveliev, M.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703980.

Exact solutions to Heisenberg equations of motion for generalized (finite, nonperiodic) Toda lattice are found in an explicit form. The perturbation expansion for dynamical operators of a certain kind reduces to finite polynomials over a coupling constant. This leads to an exact quantum description of the system.

4009 **(IFVE-OTF—82-162) Liouville supersymmetrical equation for a quantum case.** Leznov, A.N.; Khrushev, V.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703978.

The relation between coupling constants of interacting nonlinear scalar and spinor fields was established which leads to finite series of perturbation theory for the dynamical variable esup(-phi). In the classical limit $h/2\pi \to 0$ the system under consideration turns out to be described by supersymmetric Liouville equation.

4010 (INIS-BR—79, pp 179-181) **Time reversal theory in light scattering.** Oliveira, F.A. (Universidade Federal Fluminense, Niteroi (Brazil). Inst. de Fisica). Oct 1981. (In Portuguese). NTIS (US Sales Only), PC A11/MF A01. (CONF-8012117—).

From 1. Latin-American colloquium of surface physics; Niteroi, Brazil (1 Dec 1980).

The time reversal theory in light scattering by collective excitations in an insulator film is analyzed. The surface effect is included explicitly in order to improve the theory.

4011 **(INIS-BR—82) Equal-time commutation relations for non-abelian gauge field theories and Dirac brackets.** Girotti, H.O. (Rio Grande do Sul Univ., Porto Alegre (Brazil). Inst. de Fisica). [nd]. 18p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704378.

All meaningful Dirac brackets are computed, in the Coulomb gauge, for a SU(2) Yang-Mills field coupled with spin-1/2 field. The theory is quantized by abstracting the equal-time commutators from the corresponding Dirac brackets. Our results turn out to be in full agreement with those obtained by Schwinger through a significantly different method. Thus, the equivalence of both quantization schemes becomes reasonably established at the level of the operator formalism. The advantages of the quantization procedure mounted on the Dirac bracket formalism are discussed. The role played by the classical picture in the process of elaboration of the quantum dynamics becomes clarified.

4012 **(INIS-BR—83) Quantization of gauge invariant theories through the Dirac bracket formalism.** Costa, M.E.V.; Girotti, H.O. (Rio Grande do Sul Univ., Porto Alegre (Brazil). Inst. de Fisica). [nd]. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704379.

A physical system possessing first class constraints is quantized by using the Dirac bracket formalism. The main features of this quantization procedure are analyzed. The model enable us to present a situation where gauge dependent Dirac brackets given origin to gauge independent equations of motion.

4013 (INIS-SU—180, pp 14-19) **Questions of phase transition and coupling constant renormalization in the interacting instanton gas.** Ilgenfritz, E.M.; Myuller-Preusker, M. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1981. NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

Properties of the Yang-Mills instanton gas give rise at least to two effects: a first order phase transition bag-to-vacuum driven by a classical external field and a non-perturbative renormalization of the coupling constant at large distances. The aim of the paper is to check both conjectures by considering the statistical mechanics of the interacting instanton gas. The consideration is based on the dilute gas approximation involving Gaussian integration over fluctuations around superpositions of instantons and antiinstantons. It is shown that the allowance for interactions does not qualitatively affect the instanton related rise of the $\beta$ function in the interpolation region. The existence of a mechanism restricting more drastically the length scale where instanton calculations can be applied is indicated.

4014 (INIS-SU—180, pp 48-52) **Application of Gegenbauer polynomial technique to 5-loop calculations in gphi$^4$ theory.** Kataev, A.L.; Tkachev, F.V.; Chetyrkin, K.G. 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

Gegenbauer polynomial technique is developed. It implies the calculation of multiloop Feynman integrals in massless theories. Anomalous dimension of a field $\gamma_2(g)$ is calculated in the five-loop approximation in a minimal subtraction scheme of the gphi$^4$-field model. The results obtained are used for determining O(epsilon$^5$)-order term in epsilon-expansion of a universal critical index eta which characterizes the behaviour of the correlation function near the point of a second order phase transition.

4015 (INIS-SU—180, pp 52-58) **Some results of the summation of constant sign asymptotic series of perturbation theory.** Kazakov, D.I. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

The results are discussed of application of the earlier suggested technique of restoring a function from its constant-sign asymptotic expansion to two quantum physics problems: the determination of the ground energy level of an anharmonic oscillator With the twice-degenerate minimum and to construction of $\beta$-function of the renormalized group equation in the Yang-Mills theory. The technique, as applied to an explicitly solved problem, gave positive results.

4016 **(INIS-SU—180, pp 133-139) New approach to the calculation of multiloop Feynman diagrams: Gegenbauer polynomials technique in x space.** Kataev, A.L.; Tkachev, F.V.; Chetyrkin, K.G. 1981. (In Russian). NTIS (US Sales Only), PC AXX/MF A01. (CONF-8004233—).

From Seminar Quarks-80; Sukhumi, USSR (22 Apr 1980).

The technique is described for computing dimensional regularization of Feynman integrals that is based on the use of Gegenbauer polynomials in X-space. The technique permits to analytically compute the counterterms in any theory and for any composite operators at the threeloop level in the minimum subtraction circuit. An exact calculation is presented (in all orders for epsilon=(4-D)/2) for twoloop massless diagrams of a propagator type that occur in considerations of threeloop counterterms. The technique elaborated is applied to computation of threeloop corrections to the relationship $R(S)=\sigma\Xi sub(tot)(e^+e^- \rightarrow hadrons)/\sigma\Xi sub(tot)(e^+e^- \rightarrow \mu^+\mu^-)$ in QCD.

4017 **(IS—4815) Formulae for configuration averages of products of one-body and two-body operators in many-fermion spaces.** Margetan, F.J. (Ames Lab., IA (USA)). Nov 1982. Contract W-7405-ENG-82. 125p. NTIS, PC A06/MF A01. Order Number DE84002634.

Portions are illegible in microfiche products.

The trace reduction theorems (TRT) of J.N. Ginocchio and S. Ayik have greatly simplified the evaluation of the average expectation value of an operator in a basis of many-fermion states. Such averages are required for moment-method calculations of the statistical properties of many-fermion systems. The present work is aimed at simplifying the practical application of the TRT. Symmetries are used to detect distinct terms which have equal contributions to the operator average, and the minimum list of formulas which need be evaluated is presented. This is done for each product of one-body and two-body operators having four or fewer factors. The resulting formulas are applicable to both scalar average and configuration average calculations.

4018 **(ITEP—102(1982)) Generalized internal long wave equations: construction, hamiltonian structure and conservation laws.** Lebedev, D.R.; Radul, A.O. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1982. 16p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703981.

Some aspects of the theory of the internal long-wave equations (ILW) are considered. A general class of the ILW type equations is constructed by means of the Zakharov-Shabat "dressing" method. Hamiltonian structure and infinite numbers of conservation laws are introduced. The considered equations are shown to be Hamiltonian in the so-called second Hamiltonian structure.

4019 **(JINR—R-11-82-670) Symbolic evaluation of some multidimensional integrals by the computer algebraic manipulations.** Zhidkov, E.P.; Lobanov, Yu.Yu. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1982. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703825.

A description of the elaborated computer program, written in SCHOONSCHIP, is given. The program is assigned for symbolic evaluation of some multidimensional non-own integrals, arising in the quantum field theory. The integrals may depend on some parameters. The problem of the evaluation of the considered integrals is reduced to the problem of the differentiation of some expressions. The obtaining of the derivatives of required order is carried out in the program by means of the recurrent relations. The evaluated integral as a function of the parameters becomes the result of the program run. Some examples of the use of the program, obtained by the CDC-6500 computer, are given.

4020 **(LA—9856-MS) Scattering and absorption of light by soot particles.** Suydam, B.R. (Los Alamos National Lab., NM (USA)). Sep 1983. Contract W-7405-ENG-36. 15p. NTIS, PC A02/MF A01. Order Number DE84002308.

We examine the structure of a particle of soot and construct a model of an average soot particle considered as a scatterer of light. Upon comparing two quite different models we conclude that the model chosen is not sensitive to details and ought therefore to be reliable. We find that, of the total extinction cross section, about 93 percent arises from absorption and only 7 percent from scattering. This greatly simplifies the calculation of light propagation through a cloud of such particles.

4021 **(UCRL—89397) Theory of pulse propagation in fluid-saturated porous layers.** Berryman, J.G.; Bonner, B.P.; Chin, R.C.Y.; Hedstrom, G.W. (Lawrence Livermore National Lab., CA (USA)). Oct 1983. Contract W-7405-ENG-48. 18p. (CONF-8310187—2). NTIS, PC A02/MF A01. Order Number DE84002714.

From IEEE ultrasonics symposium; Atlanta, GA, USA (31 Oct 1983).

We have developed a theory for ultrasonic pulses in a porous solid layer immersed in a fluid. Biot's mixture theory is used to describe the constitutive equation of a fluid saturated porous solid. Since fast and slow waves exist in a Biot solid, there is mode conversion at the interface even at normal incidence and, therefore, the transmission and reflection coefficients are 2 x 2 matrices. We use matrix methods in developing the solution of the wave propagation problem. A generalized ray expansion algorithm is obtained by using the Gauss-Seidel matrix iterative method. The arrivals of the fast and the slow waves are easily identified. A compact computational algorithm is developed using combinatorial analysis and the Cayley-Hamilton theorem. The computed solution is compared with Plona's experiment on pulses originating in water and striking normally at a porous disk. Good agreement between theory and experiment has been found.

4022 **(WIS-PH—83/16) Breakdown of maximality conjecture in continuous phase transitions.** Mukamel, D.; Jaric, M.V. (Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Physics). Apr 1983. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700012.

A Landau-Ginzburg-Wilson model associated with a single irreducible representation which exhibits an ordered phase whose symmetry group is not a maximal isotropy subgroup of the symmetry group of the disordered phase is constructed. This example disproves the maximality conjecture suggested in numerous previous studies. Below the (continuous) transition, the order parameter points along a direction which varies with the temperature and with the other parameters which define the model. An extension of the maximality conjecture to reducible representations was postulated in the context of Higgs symmetry breaking mechanism. Our model can also be extended to provide a counter example in these cases.

4023 **Broadband population inversion by phase modulated pulses.** Baum, J.; Tycko, R.; Pines, A. (Department of Chemistry and Materials and Molecular Research Division, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* **79**: No. 9, 4643-4644(1 Nov 1983).

We present a class of continuously phase modulated radiation pulses that result in coherent population inversion over a large range of transition frequencies. The continuously modulated pulses can be approximated by sequences of discrete phase shifted pulses. Simulations of the inversion properties of the continuously modulated pulses and of the discrete pulse sequences are given.

4024 **Thermoviscous effects on acoustic scattering by thermoelastic solid cylinders and spheres.** Lin, W.H.; Raptis, A. (Components Technology Division, Argonne National Laboratory, Argonne, Illinois 60439). *Journal of the Acoustical Society of America;* **74**: No. 5, 1542-1554(Nov 1983).

This paper presents analytic solutions and numerical results of the scattering of plane sound waves from a thermoelastic circular cylinder and from a thermoelastic sphere in an infinite, thermoviscous fluid medium. The thermoelastic properties of the cylinder and the sphere and the viscosity and thermal conductivity of the surrounding fluid are taken into consideration in the solutions of the acoustic-scattering problems. We started with examining the acoustic field equations in thermoviscous fluids and in thermoelastic

solids from the standpoints of continuum mechanics and thermodynamics, and then presented the normal-mode solutions to, and numerical examples of, the acoustic scattering by a single cylinder and a sphere. The acoustic parameters of interest are the farfield scattering pattern, the acoustic-radiation force, and the absorption and scattering cross sections. These parameters were first derived in closed forms and then evaluated numerically for a given set of material properties.

4025 **Can the velocity autocorrelation function decay exponentially?.** Lee, M.H. (Department of Physics, The University of Georgia, Athens, Georgia 30602). *Physical Review Letters;* **51**: No. 14, 1227-1230(3 Oct 1983). Contract AS09-77ER01023.

For Hermitian many-body systems, admissible functions for the velocity autocorrelation function form a certain invariant of time. This property originates from a basic recurrence relation. The exponentially decaying function cannot form an invariant and therefore cannot be admissible.

4026 **Comparison of calculated and measured performance of diffused channel-waveguide couplers.** Feit, M.D.; Fleck, J.A. Jr.; McCaughan, L. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Journal of the Optical Society of America;* **73**: No. 10, 1296-1304(Oct 1983). Contract W-7405-ENG-48.

Diffused channel-waveguide couplers were fabricated on Z-cut y-propagating $LiNbO_3$ crystals by the indiffusion of titanium. Both mode spot sizes and coupling lengths were measured. The fields and coupling lengths were computed for both TM and TE polarizations from fabrication conditions. Good agreement was obtained between the measured and computed mode spot sizes and coupling lengths. It is concluded that the calculation method could aid in the design of such couplers.

4027 **Derivation of the generalized Langevin equation by a method of recurrence relations.** Lee, M.H. (Department of Physics, University of Georgia, Athens, Georgia 30602). *Journal of Mathematical Physics (New York);* **24**: No. 10, 2512-2514(Oct 1983). Contract AS09-77ER01023.

The generalized Langevin equation was first derived by Mori using the Gram-Schmidt orthogonalization process. This equation can also be derived by a method of recurrence relations. For a physical space commonly used in statistical mechanics, the recurrence relations are simple and they lead directly to the Langevin equation. The Langevin equation is shown to be composed of one homogeneous and one inhomogeneous equation.

4028 **Geometrical approach to moving-interface dynamics.** Brower, R.C.; Kessler, D.A.; Koplik, J.; Levine, H. (Lyman Laboratory of Physics, Harvard University, Cambridge, Massachusetts 02138). *Physical Review Letters;* **51**: No. 13, 1111-1114(26 Sep 1983).

A general class of models is introduced which relate the motion of a phase boundary to properties of the local interfacial geometry. These systems can undergo successive destabilizations as they grow, possibly giving rise to nonequilibrium spatial patterns. This formalism has applications to a wide variety of physical problems, especially including dendritic solidification.

4029 **Thermodynamic length and dissipated availability.** Sala-mon, P.; Berry, R.S. (Department of Mathematical Sciences, San Diego State University, San Diego, California 92182). *Physical Review Letters;* **51**: No. 13, 1127-1130(26 Sep 1983).

New expressions for the availability dissipated in a finite-time endoreversible process are found by use of Weinhold's metric on equilibrium states of a thermodynamic system. In particular, the dissipated availability is given by the square of the length of the corresponding curve, times a mean relaxation time, divided by the total time of the process. The results extend to local thermodynamic equilibrium if instead of length one uses distance (length of the shortest curve) between initial and final states.

4030 **Broadband population inversion.** Tycko, R. (Department of Chemistry and Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Physical Review Letters;* **51**: No. 9, 775-777(29 Aug 1983). Contract AC03-76SF00098.

A theory is presented for construction of sequences of phase-shifted radiation pulses for coherently inverting populations over a broad band of transition frequencies. Such sequences have applications in nuclear magnetic resonance and coherent optics. Examples of sequences are derived, together with computer simulations of their inversion properties.

4031 **Schwinger variational method for the Bloch equation.** Whitlock, P.A.; Kalos, M.H.; Chester, G.V. (Courant Institute of Mathematical Sciences, New York University, 251 Mercer Street, New York, New York 10012). *Journal of Statistical Physics;* **32**: No. 2, 389-405(Aug 1983). Contract AC02-76ER03077.

A Schwinger variational principle has been derived for use in quantum, many-body systems at finite temperatures. The variational principle is a stationary expression for the density matrix which may be iterated to improve an approximate density matrix. It also can be used to find stationary expressions for observables. If an approximate, parametrized density matrix is used, the parameters are varied to find the regions where the variatonal principle is stationary. The variational density matrix obtained with the optimal parameters can be regarded as optimal for that observable. The method has been applied to two model problems, a particle in a box and two hard spheres at finite temperatures. The advantages and shortcomings of the method are discussed.

4032 **Semiclassical quantization and extraction of eigenfunctions using arbitrary trajectories.** De Leon, N.; Heller, E.J. (Theoretical Division, T-12, MSJ569, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **78**: No. 6, 4005-4017(15 Mar 1983).

We present in this paper a coordinate independent semiclassical quantization method. We demonstrate that in order to extract accurate eigenvalues and eigenfunctions the trajectory does not necessarily have to reside on the quantizing torus, rather, one can use information obtained on arbitrary tori. Because the method is coordinate independent, no difficulty is encountered in quantizing within classical resonance zones. Furthermore, nearby eigenstates and eigenvalues (nearby in action space) may be extracted from the same trajectory: this is especially convenient when the density of states becomes large.

4033 **Quantum collision theory with phase-space distribution functions.** Carruthers, P.; Zachariasen, F. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Reviews of Modern Physics;* **55**: No. 1, 245-285(Jan 1983).

Quantum-mechanical phase-space distributions, introduced by Wigner in 1932, provide an intuitive alternative to the usual wave-function approach to problems in scattering and reaction theory. The aim of the present work is to collect and extend previous efforts in a unified way, emphasizing the parallels among problems in ordinary quantum theory, nuclear physics, chemical physics, and quantum field theory. The method is especially useful in providing easy reductions to classical physics and kinetic regimes under suitable conditions. Section II, dealing in detail with potential scattering of a spinless nonrelativistic particle, provides the background for more complex problems. Following a brief description of the two-body problem, the authors address the N-body problem with special attention to hierarchy closures, Boltzmann-Vlasov equations, and hydrodynamic aspects. The final section sketches past and possibly future applications to a wide variety of problems. .FN * On leave of absence: Los Alamos National Laboratory, Los Alamos, New Mexico 87545.

4034 **Binary multiplexing and the phase-retrieval problem.** Ghiglia, D.C. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Optics Letters;* **7**: No. 12, 602-604(Dec 1982).

A binary-mask multiplexing method is developed that provides a means of recovering phase information unambiguously from measurements of the modulus of masked complex waves in the object and image planes, respectively. The technique is developed from Fourier-transform theory and combinatorial analysis and is derived for both the continuous case (optical—digital-hybrid implementation) and the totally discrete case (digital computer simulation). Computer simulations provide unambiguous recovery of phase information and indicate that the matrix equations are reasonably well conditioned for cases of practical significance.

4035 **Test of fidelity of phase conjugation.** Falk, J. (Lawrence Livermore National Laboratory, P.O. Box 5508, Livermore, California 94550). *Optics Letters;* **7**: No. 12, 620-622(Dec 1982). Contract W-7405-ENG-48.

The fidelity of the phase-conjugate signal produced by degenerate four-wave mixing was evaluated by conjugating and recombining the multiple-beam output from a phase grating. A single output beam resulted. If one or more of the beams emerging from the grating were blocked, additional beams appeared whose relative amplitudes agreed with theory for a perfect phase conjugator.

4036 **(IC—80/118) Spinor geometry: A genesis of extended supersymmetry.** Budini, P. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1980. 16p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703972.

It is conjectured that euclidean geometry should be derived from spinor geometry through the equivalence of simple semispinor with isotropic semi n-vectors. The only tensors of complex 2n dimensional Euclidean space Esub(c)sup(2n) should then be: isotropic n - vectors and their intersections. Esub(c)$^4$ spinor geometry generates two isotropic semi bivectors equivalent to the semispinors of Esub(c)$^4$ (their geometrical properties are those of light propagating in vacuum), and their intersection: an isotropic vector (possibly representing momenta of massless particle and/or light rays); but no scalar, pseudoscalar or pseudovector is generated. In order to generate vectors outside the light cone in Msup(3.1) one needs not less than Esub(c)$^6$ spinor geometry which also generates Lorentz pseudoscalars and non isotropic pseudovectors and tensors. Besides, Dirac spinor should then always appear in doublets in Msup(3.1). Furthermore, the mer~ geometrical structure of Esub(c)$^6$ spinor geometry seems to suggest formally, both Poincare (extended) and conformal supersymmetry. The suggested spinor-geometrical approach privileges the elementary role of semispinors. Its relevance for the real world should be manifested by the privileged role of semispinors in elementary interactions as in fact seems to be the case with Lorentz semispinors in weak interactions (and could perhaps also be the case for strong ones where conformal semispinors (or twistors) could be the interacting spinor fields).

4037 **(IFVE-OTF—82-113) Two-dimensional exactly and completely integrable dynamic systems (Monopoles, instantons, dual models, relativistic strings, Lund-Regge model, generalized Toda lattice, etc).** Leznov, A.N.; Saveliev, M.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1982. 21p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703977.

An investigation of two-dimensional exactly and completely integrable dynamical systems associated with the local part of an arbitrary Lie algebra, g, whose grading is consistent with an arbitrary integral embedding of 3d-subalgebra in g has been carried out. The corresponding systems of nonlinear partial differential equations of the second order h been constructed in an explicit form and their genral solutions in the sense of a Goursat problem have been obtained. A method for the construction of a wide class of infinite-dimensional Lie algebras of finite growth has been proposed.

4038 **(JINR—E-2-82-771) Representations of osp(1,4) in terms of three boson pairs and matrices of arbitrary even order. Description of the method.** Bednar, M.; Blank, J.; Havlicek, M.; Exner, P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1982. 19p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703982.

Two-parameter family of infinite-dimensional Schur-irreducible representations of the Lie superalgebra osp (1, 4) is presented. The representations are derived in a purely algebraic way. The generators are represented in terms of tensor products of matrices 2n by 2n and polynomial functions of nine noncommuting variables psub(j), qsub(j), qsub(j)sup(-1), j=1, 2, 3, the psub(j), qsub(j) satisfying the canonical commutation relations. Besides the discrete parameter n, the representations are labelled by a continuous real parameter - the eigenvalue of the second-order Casimir operator. The even generators are represented skew-symmetrically and this property is shown to imply that each of the representations in the family is equivalent to a representation of the para-Bose algebra pB(2) having the physical "star properties": the creation and annihilation operators are adjoint to each other.

4039 **Eigenvalues of Casimir operators for the general linear and orthosymplectic Lie superalgebras.** Bincer, A.M. (Physics Department, University of Wisconsin—Madison, Madison, Wisconsin 53706). *Journal of Mathematical Physics (New York);* **24**: No. 11, 2546-2549(Nov 1983).

A Racah basis is introduced for the generators of these matrix superalgebras and explicit formulas are derived for eigenvalues of Casimir operators in terms of the components of the highest weight. The result contains, as special cases, the corresponding expressions for the general linear, orthogonal, and symplectic Lie algebras.

4040 **Completely solvable model of the nonlinear Boltzmann equation.** Ruijgrok, T.W. (Univ. of Utrecht, Netherlands); Wu, T.T. *Physica A (Amsterdam);* **113**: 401-416(1982). Contract AC02-76ER03227.

In one space and one time dimension, a model of the nonlinear Boltzmann equation is presented that is exactly solvable for all initial conditions. Furthermore, this model has the following desirable properties: (1) conservation of the number of particles; (2) energy conservation; (3) nonlinearity; (4) positivity of distribution functions; and (5) unique equilibrium state (for any given density) which is approached as $t \to \infty$ for most physically interesting initial conditions. Some of the simple properties of this model are studied.

4041 **(CLM-R—227) Soft X-ray imaging diagnostic on the HBTX 1A reversed field pinch.** Malacarne, M.; Hutchinson, I.H. (UKAEA Culham Lab., Abingdon). Sep 1982. 32p. Available from HMSO, London, price Pound 2.00.

Soft x-ray emission from the central region of the HBTX 1A reversed field pinch plasma has been measured using a pinhole camera with an array of surface barrier diodes. Internal fluctuations of the plasma, which include a significant turbulent component as well as more coherent modes, are measured using spectral and correlation analysis techniques. Results indicate the different correlation lengths for different fluctuation frequencies.

4042 **(CLM-R—229) Calculation of spectrum line emission from plasmas.** Gordon, H.; Tully, J.A.; Summers, H.P. (UKAEA Culham Lab., Abingdon). 1982. 41p. HMSO, London, price Pound 3.00.

This is the first of a series of papers which will describe a number of Fortran computer programs and their associated data sets which will predict spectrum line emission from important spe-

cies in fusion plasmas. The present work is concerned with the emission of line radiation by low lying excited states of ions. Three sets of plasma conditions are investigated, namely, the ionisation equilibrium plasma, the plasma developing in time and the plasma in a spatially inhomogeneous state.

4043 **(CLM-R—233) Tokamak disruptions.** Wesson, J.A.; Sykes, A.; Turner, M.F. (UKAEA Culham Lab., Abingdon). 1982. 9p. Available from HMSO, London, price Pound 2.00.

An explanation is given for the occurrence of tokamak disruptions. Under normal conditions the tearing instability is self-stabilising through its reduction of the destabilising current gradient and a saturated state can then exist. However under certain conditions further growth of the instability is itself destabilising and a disruption results. The transition to disruption has the form of a catastrophe.

4044 **(CLM-R—234) Models and codes for the plasma edge region.** Harbour, P.J.; Morgan, J.G. (UKAEA Culham Lab., Abingdon). Dec 1982. 121p. Available from HMSO, London, price Pound 6.00.

Models of the edge region of a toroidal plasma are described and developed, the eventual aim being to be able to link plasma models of one-dimensional parallel flow to a radial transport code and ultimately to an overall model of the NET system. It is concluded that parallel flow requires a two-fluid description, evaluated numerically or analytically. The full numerical approach, using program ZEPHYR, which is fully documented, is used for many test cases of the parallel flow model.

4045 **(CONF-8209191—1) Measurements of the microwave power in the wall at EBT-I/S.** Rasmussen, D.A.; Batchelor, D.B.; Hankins, O.E. (Oak Ridge National Lab., TN (USA); North Carolina State Univ., Raleigh (USA)). 1982. Contract W-7405-ENG-26. 14p. NTIS, PC A02/MF A01. Order Number DE84000199.

From 3. international workshop on ECE and ECRW; Madison, WI, USA (9 Sep 1982).

An understanding of the microwave propagation and absorption in Elmo bumpy torus is critical because the plasma production, the heating, and the stabilization provided by the hot electron rings are dependent on these processes. A microwave power balance model was proposed earlier for EBT. This paper will describe a series of simple experiments designed to test this model by comparing its predictions and assumptions to both calorimetric and broad beam antenna measurements of microwave power at the wall in EBT-I/S.

4046 **(DOE/ER/53111—1) Fusion-product energy and particle loss from tandem-mirror reactors by nuclear scattering.** Kantrowitz, F.; Conn, R.W. (California Univ., Los Angeles (USA). Center for Plasma Physics and Fusion Engineering). Oct 1981. Contract AT03-81ER53111. 23p. NTIS, PC A02/MF A01. Order Number DE83016801.

Portions are illegible in microfiche products.

At high temperatures, large-angle nuclear elastic scattering can be significant for high-energy fusion products slowing down and pitch-angle scattering into the loss cone. An accurate treatment requires that the discrete nature of nuclear-scattering reactions be accounted for. For this purpose, a multigroup model has been formulated from a linearized Boltzmann equation. The fraction of fusion-product energy deposited in ions and electrons and lost is computed. Comparison is made to previous work where coulomb scattering alone in a TMR is considered and where nuclear and coulomb scattering are considered in an infinite plasma. Large-angle-scattering losses are found to depend more strongly on mirror ratio than do small-angle-scattering losses.

4047 **(DOE/ER/53112—T1) FIR laser-development program. Final report.** Danielwicz, E.J.; Hodges, D.T. (Aerospace Corp., Los Angeles, CA (USA). Electronics Research Lab.). 1980. Contract AC03-81ER53112. 16p. NTIS, PC A02/MF A01. Order Number DE83016541.

The important features for a source intended for use as a local oscillator in a low noise receiver have been tested on a developmental model of a cw FIR laser package. High output power (45 mW), good long term amplitude stability (+- 3%), high spectral purity and excellent frequency stability have all been demonstrated in the laboratory environment.

4048 **(DOE/ER/53140—10) Monte Carlo studies of tandem-mirror plasmas interacting with waves in the ion-cyclotron range of frequencies (ICRF). Annual report, October 1, 1982-September 30, 1983.** Todd, A.M.M. (Grumman Aerospace Corp., Princeton, NJ (USA)). Sep 1983. Contract AC02-82ER53140. 11p. NTIS, PC A02/MF A01. Order Number DE84002356.

A study of RF start-up, RF Fueling, and RF Anchor operation in Tandem Mirrors has been completed. Significant results include finding little performance difference between inboard and outboard antennas, and an optimum central-cell electron-to-ion-temperature ratio of between one and two. Several variance-reduction techniques, improved RF operators and a Monte Carlo neutral model have been incorporated in the code. Ongoing activities include studies of central-cell ICRF heating and hot-electron anchor operation of Tandem Mirrors, and Development of Monte Carlo non-maxwellian scattering operators. Completion of these ongoing activities, conversion of our Monte Carlo ICRF code to the NMECC CRAYS, and initial development of a new Monte Carlo RF code for 3-D mirror equilibrium geometries comprises our proposed program for FY '84.

4049 **(DOE/ER/53150—T2) Reversed field pinch dynamics and transport studies. Quarterly progress report, 20 July 1983-20 October 1983.** Schnack, D.D. (Science Applications, Inc., La Jolla, CA (USA)). 20 Oct 1983. Contract AC03-83ER53150. 9p. NTIS, PC A02/MF A01. Order Number DE84002124.

Progress in RFP dynamics and transport studies is described. The compressible, three-dimensional code SPECTR3 has been modified to include toroidal effects, and classical resistivity and thermal conductivity. Anomalous transport arising from stochastic magnetic fields has been included in the model. These transport effects are treated implicitly. A three-dimensional, incompressible MHD code has been developed. It is computationally more efficient than the existing code, and will be used extensively if compressibility is determined to be unimportant. Post-processor codes to analyze data generated by the nonlinear code have been developed. Three-dimensional computer runs at low Θ (= B/sub theta/(a)/<B/sub Z/>) have found the development of a substantial stochastic core, with good flux surfaces being retained in the outer part of the discharge. Runs at high Θ have shown complete stochasticity, with reappearance of outer flux surfaces as the modes saturate and relax. Anomalous maintenance of positive toroidal flux arising from a poloidal electric field at the field reversal surface induced by MHD fluctuations (dynamo) has been observed. We are collaborating with the ETA-BETA-II experimental group at Padua, Italy, in an attempt to interpret measured internal fluctuations and profiles in terms of resistive MHD. The emphasis of this work is on the effect of MHD fluctuations plasma transport. Analytic studies of the RFP dynamo have begun. We are attempting to find steady state solutions with flow to the resistive MHD equations. A reduced model to simulate phenomena that occur on the relaxation time scale, such as F-Θ current drive, has been formulated.

4050 **(DOE/ER/54010—T1) Research on modeling of FED/INTOR radio-frequency heating and studies of FED/INTOR impurity-control mechanisms. Final technical report.** Conn, R.W. (California Univ., Los Angeles (USA)). 1983. Contract AT03-82ER54010. 13p. NTIS, PC A02/MF A01. Order Number DE83016756.

Portions are illegible in microfiche products.

A one-dimensional model describing the species and spatial power deposition profiles for the fast wave second harmonic heating scheme in a tokamak was developed. In this model, the plasma is divided along the midplane into vertical slabs, in each of which the plasma parameters and the magnetostatic field are assumed to be uniform. Using the full kinetic treatment, the local dispersion relation for the fast and ion-Bernstein modes is solved, and the wave field is written as a sum of the individual mode components. Limiter design evolution has converged to a rigidly mounted, large area,

slotted flat plate toroidal limiter. Efficient particle removal is achieved by locating the neutralization site remotely from the plane of slots. The plasma flows behind the limiter and, using an inclined deflector/neutralizer plate is ballistically scattered toward an off-centre pump duct. In view of the relatively long He mfp, use of a deflecting plate eases the problems arising from excessive de-enrichment at the pump.

4051 **(DOE/ET/51013—100) Study of parametric instabilities during the Alcator C lower hybrid wave heating experiments.** Takase, Y. (Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). Oct 1983. Contract AC02-78ET51013. 225p. NTIS, PC A10/MF A01. Order Number DE84002809.

Parametric excitation of ion-cyclotron quasi-modes (ω/sub R/ ≃ nω/sub ci/) and ion-sound quasi-modes (ω/sub R/ ≃ k/sub parallel to/v/sub ti/) during lower hybrid wave heating of tokamak plasmas have been studied in detail. Such instabilities may significantly modify the incident wavenumber spectrum near the plasma edge. Convective losses for these instabilities are high if well-defined resonance cones exist, but they are significantly reduced if the resonance cones spread and fill the plasma volume (or some region of it). These instabilities preferentially excite lower hybrid waves with larger values of n/sub parallel to/ than themselves possess, and the new waves tend to be absorbed near the outer layers of the plasma. Parametric instabilities during lower hybrid heating of Alcator C plasmas have been investigated using rf probes (to study tilde phi and tilde n/sub i/) and $CO_2$ scattering technique (to study tilde n/sub e/). At lower densities (anti n/sub e/ $\leqq$ 0.5 x $10^{14}cm^{-3}$) where waves observed in the plasma interior using $CO_2$ scattering appear to be localized, parametric decay is very weak. Both ion-sound and ion-cyclotron parametric decay processes have been observed at higher densities (anti n $\geqq$ 1.5 x $10^{14}cm^{-3}$) where waves appear to be unlocalized. Finally, at still higher densities (anti n /sub e/ greater than or equal to 2 x $10^{4}cm^{-3}$) pump depletion has been observed. Above these densities heating and current drive efficiencies are expected to degrade significantly.

4052 **(DOE/ET/53001—4) Applications of hybrid numerical-simulation methods to magnetic-confinement systems.** Morse, R.L. (Arizona Univ., Tucson (USA)). [nd]. Contract AC02-77ET53001. 41p. NTIS, PC A03/MF A01. Order Number DE84001134.

During this contract period we started out to extend and refine our kinetic modeling of wall plasmas near divertors or limiters to include, in particular, prediction of sputtering rates. As a result of seeing data indicating edge temperatures below the kinetic range, and some questions about previous fluid modeling, we also began our own fluid modeling. One of the fluid results which we found interesting is a class of solutions which are not stationary but exhibit periodic relaxation oscillations. We speculate about a possible relationship between these solutions and the H-mode. Also during this period we have done calculations of Argon radiation power at typical Tolemak densities and over a wide range of temperatures. The power at typical Tolemak densities and over a wide range of temperatures. The results of this work may have interesting implications for main plasma energy containment and ignition as well as for edge plasma control.

4053 **(DOE/ET/53045—7) Nonlinear magnetohydrodynamic. Summary of recent activity (Task I). Progress report.** (College of William and Mary, Williamsburg, VA (USA)). Sep 1983. Contract AS05-76ET53045. 15p. NTIS, PC A02/MF A01. Order Number DE84002638.

We are currently investigating the effects of including sufficient ICRH that the ambipolar electric field E/sub r/ > 0 so that the ions are non-resonant. Dandl and Guest have recently pointed out that if a steady state regime can be found with E/sub r/ > 0, then the particle confinement time (which is set by ion scattering) can be increased by a factor of (m/sub i//m/sub e/)/sup 1/2/, - the square root of the mass ratio. However, Hedrick has pointed out to us that while the particle transport can be reduced by (m/sub e//m/sub i/)/sup 1/2/, the energy transport need not be so reduced because the dependence of the energy flux on E/sub r/ and the control variables (filling pressure, microwave power densities) is different from that of the particle flux. We intend to compare both cases: reduced energy flux and unaffected energy flux.

4054 **(DOE/ET/53088—110) Beat-wave current drive in a magnetized plasma.** Galvao, R.M.O.; Tajima, T. (Texas Univ., Austin (USA). Inst. for Fusion Studies). Sep 1983. Contract FG05-80ET53088. 14p. NTIS, PC A02/MF A01. Order Number DE84001556.

It is shown that large currents can be efficiently driven in magnetically confined plasmas by the ponderomotive force created by the beating of two electromagnetic waves. The beating waves can be cyclotron waves propagating parallel to the magnetic field or light waves propagating obliquely to the magnetic field.

4055 **(EUR-CEA-FC—1170) Computation code for the energy deposition calculation of a resonant wave near the electron cyclotron frequency.** Cano, R.; Capes, H.; Ha Quang, D.; Mercier, C.; Morera, J.P. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Recherches sur la Fusion Controlee). Feb 1983. 19p. (In French). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700014.

A model is developed which allows a calculation of the energy deposition in a Tokamak plasma from an electron cyclotron wave for an ordinary mode propagating from the exterior near the equatorial plane and at right angles to the magnetic field. The calculation, in cylindrical geometry, takes account of the spatial width of the incident beam and of its energy profile in the direction perpendicular to the equatorial plane. A numerical code coupled to the Makokot transport code is described.

4056 **(EUR-CEA-FC—1171) Magnetic islands and turbulence.** Mercier, C. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Recherches sur la Fusion Controlee). Feb 1982. 36p. (In French). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700015.

The magnetic islands which develop in fusion plasmas play a very significant part in the global "behaviour" of this medium. In this article general analytical expresion are drawn up, which are compared with a great number of digital calculations of magnetic lines. The model used reproduces very well the principal characteristics of the discharges with internal disruption. On this model, the analytical formulae can be generalized semi-empirically, thus enabling the digital results to be very well represented and the interactions between islands to be understood, as well as the start of the turbulent stage in these plasmas.

4057 **(EUR-CEA-FC—1173) Design and construction of a $D_2O$ oscillator with optical pumping to measure the ion temperature of a plasma by Thomson scattering.** Bruneau, J.L. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Recherches sur la Fusion Controlee; Orleans Univ., 45 (France)). Feb 1983. 163p. (In French). NTIS (US Sales Only), PC A08/MF A01. Order Number DE84700016.

Because of the close relation between the $D_2O$ pulse and the pumping pulse, and the inadequate spectral quality of pulsed $CO_2$ laser beams, we were led to consider optical pumping as a whole. We designed an oscillator with emphasis on mechanical stability. The single-mode energy had to be increased, with a reproducibility close to 100% and a flexibility of use and conversion appropriate to the study of the $D_2O$ oscillator. Then, with the density matrix formalism, we defined theoretically the response at 66 μm from the $D_2O$ molecular system excited by the 9.657 μm line of the single-mode $CO_2$ laser. For the first time, this analysis is given systematically for the Raman transition. The discussion demonstrates several characteristic features of this emission, such as the dynamic Stark effect and frequency slip. It is generalized to pumping by a $CO_2$ pulse containing only longitudinal modes. Detailed spectrum analysis and a study of the $D_2O$ pulse polarization yields firstly an experimental configuration of the theoretical results. We then derive the operating conditions under which the $D_2O$ pulse can satisfy the criteria for Thomson scattering. In the final section, the $D_2O$ oscillator pulse is compared with an open cavity pulse under the same pumping conditions.

4058 **(IAE—3588/16) Program complex for computation of the two-dimensional plasma distribution function in the OGRA-4 magnetic trap.** Pozharov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1982. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703992.

A set of computer codes is described for two-dimensional calculation of the plasma distribution function in the OGRA-4 magnetic trap. The code is intended for computing the plasma parameters in traps of a baseball configuration. The computer code has a block structure and may be used both independently and in conjuction with other computer codes. Practically all the codes are written in the FORTRAN-GDR language, with minor quantity of codes being written in the MADLEN autocode.

4059 **(IAE—3600/6) Transport factors due to the dissipative ballooning models.** Gribkov, V.M.; Pogutse, O.P.; Shurygin, R.V.; Yurchenko, Eh.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1982. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700019.

Ballooning modes in unideal plasma are considered and the effect of the finite conductivity and anomalous viscosity on their development is investigated. The anomalous viscosity is shown to result in an abrupt increase of instability increments. The plasma stability criterion relative to finite amplitude oscillations has been obtained. Turbulent transport factors due to the ballooning mode development have been calculated.

4060 **(IC—82/132) Radial distribution function and second virial coefficient for interacting bosons.** Khanna, K.M.; Singh, S.C. (International Centre for Theoretical Physics, Trieste (Italy)). Aug 1982. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703993.

Radial distribution function and second virial coefficient have been calculated for a dilute and high density system of interacting bosons using Gaussian potential and Lennard-Jones potential as the two-body interaction potential. The results have been compared with those obtained experimentally for liquid $He^4$.

4061 **(ILE—8202P) Generation of super-fast ions due to nonlinear processes near the quarter critical density in laser-produced plasmas.** Yamada, Kawakatsu; Sakabe, Shuji; Miyanaga, Noriaki; Inada, Yoshifumi; Kato, Yoshiaki. (Osaka Univ., Suita (Japan). Inst. of Laser Engineering). 19 Jan 1982. 18p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700020.

We have experimentally studied the correlation between the $3/2\omega_0$ emission of radiation and the generation of super-fast ions (>=MeV) which we have observed for the first time. It was found that the generation of the super-fast ions are correlated with the appearance of the filamentary structure in the spatial distribution of the $3/2\omega_0$ emission. We will show that the super-fast ions are generated by the acceleration due to the ambipolar field of super-hot electrons which are produced in the small scale filaments in the underdense plasma near the quarter critical density.

4062 **(INIS-mf—8577) Wills Plasma Physics Department annual progress report 1982.** (Sydney Univ. (Australia). School of Physics). 1982. 34p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83703994.

Progress in the experimental program using the research tokamak TORTUS is presented. The main thrust of the program is the study of the characteristics of hydromagnetic waves in tokamak plasmas and in the use of such waves in r.f. heating. Work on runaway electron production, on wave propagation in collisional plasmas and on hydromagnetic shock wave studies is reported. Diagnostic techniques and equipment described include a laser interferometer system and techniques based on the observation of resonance fluorescence and near-resonant scattering of a laser beam from atomic species in a plasma.

4063 **(IPPJ—552) Population inversion in an optically thick recombining hydrogen plasma.** Furukane, Utaro; Yokota, Toshiaki; Kawasaki, Ken; Oda, Toshiatsu. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1982. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700021.

The plasma condition is theoretically investigated for population inversion between the first two excited states of hydrogen atoms in a recombining plasma. The rate equation including atom-atom collision terms is solved consistently with the optical escape factors. The upper bound value of the ground level population density (n1)sub(max) necessary for inversion in the optically thick plasma at specified electron density and temperature is almost inversely proportional to the mean radius of the plasma $r_0$. With decrease in the atom temperature, the upper bound values increase in the optically thin plasma, but decrease in the optically thick plasma.

4064 **(IPPJ—554) Electron cyclotron heating of stellarator plasma with the ordinary and the extraordinary modes in JIPP T-II.** Ohkubo, K.; Kawahata, K.; Noda, N.; Ogawa, I.; Kako, E. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1982. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700023.

Experimental studies of electron cyclotron heating in stellarator plasma have been carried out by injecting 40 kW of 35.5-Ghz microwave power. Electron cyclotron heatings with the ordinary and the extraordinary modes injected from the low field side show almost the same heating efficiency of $2.2 \times 10^{13}$ eV.cm$^{-3}$.kW$^{-1}$ at the averaged electron density of $6 \times 10^{12}$ cm$^{-3}$. Efficient heating by the extraordinary mode in the presence of the cyclotron cutoff is interpreted to be achieved by the penetration of scattered waves from high and low field sides, because the wave polarization is scrambled by the reflection at the chamber wall.

4065 **(IPPJ—555) Conversion of compressional Alfven waves into ion cyclotron waves in inhomogeneous magnetic fields.** Amagishi, Y.; Tsushima, A.; Inutake, M. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1982. 14p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700024.

Axisymmetric compressional Alfven (fast) waves, which propagate into a region of an increasing magnetic field in a cylindrical plasma, are observed to be converted into ion cyclotron (slow) waves via ion cyclotron resonances.

4066 **(IPPJ—556) Mode conversion and local heating below the second electron cyclotron harmonic.** Sugai, H. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1982. 13p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700025.

An extraordinary wave is normally incident on a large volume magnetoplasma. Below the second gyroharmonic, conversion into short-wavelength Bernstein wave is observed near the upper-hybrid layer. Significant conversion efficiency is attained in the optimum conditions. In the high-power incidence, considerable electron heating due to the converted wave is found to be localized in the mode-conversion region.

4067 **(IPPJ—557) Heat flux in the presence of shifting cold and hot electron Maxwellian distributions.** Ichiba, Hideo; Ogasawara, Masatada. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1982. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700026.

Heat flux is evaluated in the case of shifted Maxwellian velocity distribution function with cold and hot electrons. The heat flux associated with the cold electron temperature gradient nabla sub(x)T sub(C) tends to flow in the direction of increasing T sub(C). This flux inversion is enhanced due to the shifting velocities of the cold and hot electrons. Even for a small shifting velocity as mv sub(H)sup(2)/2T sub(H) = 0.3 (v sub(H) and T sub(H) are the shifting velocity and the temperature of the hot electrons), value of the heat flux becomes more than twice as large as the value without the shifting velocities.

4068 **(IPPJ—558) Stabilization of electrostatic flute mode due to hot electron ring and rf field.** Sanuki, H. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1982. 28p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700027.

The stability of electrostatic flute modes has been studied on the basis of a relatively simple model of a bumpyless cylinder with artificial gravity and an ambipolar field. The dynamic stabilization of these modes due to the rf electric field has also been discussed. It turned out that the electrostatic flute modes could be stabilized effectively by the rf field together with the effects of hot electron ring.

4069 **(IPPJ—559) Possible method for burn control by compression-decompression.** Okamoto, Masao; Hirano, Keiichi; Ohnishi, Masami. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1982. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700028.

The possible method for the control of burning plasmas in ignited tokamaks is presented. By applying the small scale major radius compression-decompression repeatedly to the plasma with the feedback control, the thermal instability can be suppressed and the plasma stays at an unstable ignition equilibrium point. The variation of major radius $\Delta R$ during the control scales like $\Delta R/R \sim -\Delta n/2n$, where R is the major radius, n is the density and $\Delta n$ is the change in density during control.

4070 **(IPPJ—567) Experiment on heating with simultaneous injection of neutral-beam and lower hybrid waves in the JIPP T-II torus.** Noda, N.; Kaneko, O.; Ohkubo, K. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Apr 1982. 25p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700029.

A hydrogen beam of 16 kV, 4 A was co-injected into hydrogen plasmas and coupled to an rf of 800 MHz, up to 150 kW. It has been observed with the measurement of parallel charge-exchange neutrals that the fast ions above 16 keV are enhanced by the interaction with the lower hybrid waves. The enhancement is critically reduced when the line-averaged electron density is higher than $1.6 \times 10^{13}$ cm$^{-3}$ both in the toroidal fields of 22 kG and 16 kG. For the 22 kG case, the cause of the reduction may be related to the location of the turning point of the incident waves; that is, the turning point, in higher densities, locates outside the region where the fast ions produced by NBI are relatively abundant. For the 16 kG case, however, this interpretation is valid only when a part of the incident wave energy is transferred into waves of shorter wavelengthes. The ion-temperature increment in the simultaneous heating agrees with the sum of those in the individual heatings even when the beam-rf interaction is considerably strong.

4071 **(IPPJ—575) Analysis of current drive by travelling wave based on theory of intrinsic stochasticity.** Murakami, Akihiko; Midzuno, Yukio. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Apr 1982. 31p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700030.

The mechanism of the current generation in a collisionless plasma by a train of travelling mirrors with modulated phase velocity is studied based on the theory of intrinsic stochasticity. It is shown that, if the phase modulation is small, the main contribution to the current generation comes from the phase mixing of the trajectories of trapped electrons in each Fourier component of a driving wave. For the case of a moderate phase modulation, however, formation of a large stochastic region due to the overlapping of primary resonances is very effective for increasing the generated current. Large phase modulation has little advantage in the current generation because the stochastic regions are formed, so to speak, at random in the phase plane. The results of analytical evaluation based on the above theory agree quite well with results of numerical experiments.

4072 **(IPPJ—576) Evolution of ring current formed by relativistic electron beam injection into a charge but not current neutralizing plasma.** Narihara, Kazumichi. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Apr 1982. 20p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700031.

The time evolutions of the azimuthal momentum distribution of the axisymmetrically injected electrons and the resulting ring current are self-consistently analyzed under the assumption that no return current is induced in the background plasma. It is shown that the ring current grows linearly with time for a characteristic time from the start of beam injection, and afterthere it tends to saturate at some level. The dependence of the time evolution of the ring current on the beam energy at injection and on the injection current is also obtained.

4073 **(IPPJ—580) Determination of metastable fraction in an ion beam extracted from ECR plasma.** Matsumoto, Atsushi; Ohtani, Shunsuke; Iwai, Tsuruji. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Apr 1982. 29p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700032.

The fraction of metastable-state $Ar^{2+}$ ($3p^4$ $^1D$) ions in $Ar^{2+}$ beam has been determined by an optical attenuation method (OAM) combined with the conventional beam attenuation method. The present OAM is based on observation of spatial decay of specified emission line intensities arising from charge-changed ions, along the beam axis in a target gas cell. The validity of the OAM is discussed in detail. The cross sections for one-electron capture by the ground-state $Ar^{2+}$ ($^3P$) ions, $\sigma_{21}$, and by the metastable-state $Ar^{2+}$ ($^1D$) ions, $\sigma_{21}$ *, from Na have been measured independently by the OAM. Both the cross sections are of the order of $10^{-14}$ cm$^2$ and $\sigma_{21}$ * is about 1.3 times as large as $\sigma_{21}$ at the collision energy of 1.5 keV.

4074 **(IPPJ—583) Formation of relativistic electron beam rings in a conducting cavity.** Mohri, Akihiro; Narihara, Kazumichi; Tomita, Yukihiro; Tsuzuki, Tetsuya; Hasegawa, Mitsuru. (Nagoya Univ. (Japan). Inst. of Plasma Physics). May 1982. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700033.

It was experimentally demonstrated that a relativistic electron beam ring of spheromak configuration is formed and stably kept in a conducting cavity of rectangular cross section without any help of external magnetic field for equilibrium. Here, a rotating electron beam was injected through a hole of the cavity.

4075 **(ITF—82-69-R) Fluctuation and radiation processes in bounded plasma-molecular systems.** Golubinskij, P.K.; Zagorodnij, A.G.; Pegova, V.S.; Yakimenko, I.P. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1982. 56p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83703995.

Theory of fluctuations and spontaneous emission of semiconfined and confined partially-ionized plasma with provision for system nonequilibrium, thermal motion of charged particles, collisions of electrons and ions with neutral and dynamics of a molecular subsystem is developed. Calculation of fluctuation spectra is performed on the basis of the Langevin approach. At that, interaction of electromagnetic fields with atoms and molecules is described with equation of motion of polarization vector of two-level quantum system and induced currents in charged particle subsystems are determined on the basis of probable approach when using the Bhatnagar-Gross-Krook model for describing collisions of electrons and ions with neutral particles. Correlation functions of fluctuation sources related to electron and ion subsystems are determined within the framework of probable approach and correlation functions of polarization sources - on the basis of generalization of fluctuation-dissipative theorem. Effect of active molecules on spectral distribution of fluctuations and emission intensity of half-space and layer of nonequilibrium plasma is investigated.

4076 **(KFTI—82-48) Far infrared heterodyne laser interferometer.** Berezhnyj, V.L.; Epishin, V.A.; Kononenko, V.I.; Maslov, V.A.; Pavlichenko, O.S.; Svich, V.A.; Topkov, A.N. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). 1982. 26p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700035.

Results of developments of a heterodyne submillimeter laser interferometer (lambda=118.8 $\mu$m) for the measurement of the

plasma electron concentration are given. Structural peculiarities of interferometer quantum generators and elements are described. A method for investigating characteristics of oscillation types of laser resonators containing side dielectric walls and large-scale (d >> lambda) amplitude phase inhomogeneities in reflectors has been theoretically developed. Results of investigation of interferometer working capacity on a plasma device and measurements of the plasma electron concentration are presented. Minimal measured phase shift $\Delta phi/2\pi = 10^{-2}$ (nLsub(min)=2.8x10sup(13) $cm^{-2}$), time resolution is $10^{-6}$ s. Specifications of a set of interferometer apparatuses are given.

4077 **(LA—9848-MS) Plasma effects on Heliac configurations: a preliminary investigation.** Mondt, J.P. (Los Alamos National Lab., NM (USA)). Aug 1983. Contract W-7405-ENG-36. 30p. NTIS, PC A03/MF A01. Order Number DE84002299.

Plasma effects on equilibrium, stability, and transport properties of helical stellarators with a hardcore current through the center (Heliac) are investigated, mainly analytically and with an emphasis on understanding the underlying physics and rough scaling rather than on accuracy and completeness. The presently reported results provide a focus in parameter space for further detailed research on the feasibility of the Heliac concept, as well as some tools with which to carry out such investigations.

4078 **(NIIEFA-P-K—0570) Development and study of the first-stage amplification unit of the TIR-1M $CO_2$-laser installation.** Burtsev, V.A.; Gordejchik, A.G.; Kuchinskij, A.A.; Rodichkin, V.A.; Sheverev, V.A. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1982. 26p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700037.

Results of experimental study of the pumping system of pulse $CO_2$-laser (amplifier) with ultraviolet preionization are described. Dependences of the small signal amplification factor and its distribution along the amplification aperture on the parameters of discharge-supplying system, pressure and composition of the mixture are obtained. The parameters of the pumping system providing for uniform spatial amplification factor distribution, its value runs into 0.0375 $cm^{-1}$. Laser parameters being optimized, the energy output is approximately 30 J/lxatm, the efficiency is approximately 9%. Study of possible laser operation with selective resonator is carried out. Results of experiments on slightly ionized impurity effect on pumping discharge characteristics are dicussed.

4079 **(ORNL/TM—8713) Preionization and start-up in the ISX-B tokamak using electron cyclotron heating at 28 GHz.** Kulchar, A.G.; Eldridge, O.C.; England, A.C.; Bush, C.E.; Edmonds, P.H.; Kelley, G.G.; Loring, C.M.; Peng, Y.K.M.; Wilgen, J.B.; Borowski, S.K. (Oak Ridge National Lab., TN (USA)). Oct 1983. Contract W-7405-ENG-26. 31p. NTIS, PC A03/MF A01. Order Number DE84002261.

A 28-GHz gyrotron was used to produce a plasma at the electron cyclotron resonance in the Impurity Study Experiment (ISX-B) tokamak. The influence of the toroidal magnetic field magnitude, error fields, gas pressure, microwave power, microwave pulse length, and microwave timing was studied for experiments with magnetic field and gas only. Also, experiments with preionization followed by capacitor discharges were carried out in which these quantities were varied, as were the capacitor bank voltages. Optimum conditions of preionization for some of the parameters were determined. A theoretical model that adequately reproduces the data is given. Calculations based on this model show the temporal evolution of the electron temperature and density, the neutral density, and the plasma current. The model adequately accounts for present and previous experimental results and can be used to make predictions for future experiments.

4080 **(ORNL/TM—8837) WHISTBT: a 1-1/2-D radial-transport code for bumpy tori.** Hastings, D.E.; Houlberg, W.A.; Attenberger, S.E.; Lee, D.K. (Oak Ridge National Lab., TN (USA)). Oct 1983. Contract W-7405-ENG-26. 69p. NTIS, PC A04/MF A01. Order Number DE84002269.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

The computer code WHISTBT has been developed from the Oak Ridge National Laboratory WHIST code to study radial transport in bumpy tori. The code can handle both positive and negative ad hoc electric fields for devices ranging from the size of ELMO Bumpy Torus-Scale (EBT-S) to a reactor-type device, EBT-R. Fueling can be by gas puffing or pellets; heating can be by injection of rf power or neutral beams.

4081 **(ORNL/TM—8871) Oak Ridge National Laboratory ELMO Bumpy Torus radially resolved, time-dependent, one-dimensional transport code - user's guide.** Downum, W.B.; Jaeger, E.F. (Oak Ridge National Lab., TN (USA)). Nov 1983. Contract W-7405-ENG-26. 81p. NTIS, PC A05/MF A01. Order Number DE84002976.

The Oak Ridge National Laboratory Radially Resolved Time-Dependent One-Dimensional Transport code is described. The physical models and numerical techniques incorporated to follow the time evolution of ELMO Bumpy Torus plasmas ranging in size from the present experiment to power reactors are discussed. Sample input/output files are presented, and instructions for use on the Oak Ridge DEC-10 and the National Magnetic Fusion Energy Computer Center CRAY systems are given.

4082 **(ORNL/TM—8874) Observation of hot-electron ring instabilities in ELMO Bumpy Torus.** Hiroe, S.; Wilgen, J.B.; Baity, F.W.; Berry, L.A.; Colchin, R.J.; Davis, W.A.; El Nadi, A.M.; Haste, G.R.; Hillis, D.L.; Spong, D.A. (Oak Ridge National Lab., TN (USA)). Dec 1983. Contract W-7405-ENG-26. 50p. NTIS, PC A03/MF A01. Order Number DE84002973.

A high-frequency hot electron instability is observed in ELMO Bumpy Torus (EBT) plasmas when the hot electron-to-ion density ratio exceeds 0.4. Both the real frequency and the imaginary frequency are larger than the ion cyclotron frequency. The azimuthal mode number (m) is 7, and the instability rotates in the hot electron curvature drift direction. This instability is identified as a curvature-driven mode. When it is strongly excited, the equilibrium of the hot electron annuli and confined core plasmas are destroyed (disruption). Extensive ion heating and neutron bursts are associated with this instability.

4083 **(RL—82-116) Decay of an electromagnetic wave into an ion-acoustic wave and a Langmuir mode which is heavily damped.** Bingham, R. (Science Research Council, Chilton (UK). Rutherford and Appleton Labs.). Dec 1982. 16p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703999.

The parametric decay of an electromagnetic wave into an ion-acoustic wave and a heavily damped Langmuir mode is studied. The instability is not localized to the critical density region but can occur in sub-critical density regions where ksub(l) γsub(de) approximately > 1. The instability increases absorption of electromagnetic waves in a plasma, the energy going mainly into the production of fast electrons.

4084 **(UCRL—89570) Streak cameras for soft x-ray and optical radiation.** Medecki, H. (Lawrence Livermore National Lab., CA (USA)). 1 Sep 1983. Contract W-7405-ENG-48. 8p. (CONF-831195—2). NTIS, PC A02/MF A01. Order Number DE84002780.

From International congress on applications of lasers and electro-optics; Los Angeles, CA, USA (14 Nov 1983).

Portions are illegible in microfiche products.

The principal component of a streak camera is the image converter tube. A slit-shaped photocathode transforms the radiation into a proportional emission of electrons. An electron - optics arrangement accelerates the electrons and projects them into a phosphor screen creating the image of the slit. A pair of deflection plates deflects the electronic beam along a direction perpendicular to the main dimension of the slit. Different portions of the phosphor screen show the instantaneous image of the slit with brightness proportional to the number of emitted electrons and, consequently, to the intensity of the radiation. For our x-ray streak cameras, we use the RCA C73435A image conventer tube intended for the measurement of the radiation of light and modified to have an

x-ray sensitive photocathode. Practical considerations lead to the use of transparent rather than reflecting photocathodes. Several of these camera tubes are briefly described.

4085 **Measurements of plasma ion temperature and rotation velocity using the He II 4686-A line produced by charge transfer.** Groebner, R.J.; Brooks, N.H.; Burrell, K.H.; Rottler, L. (GA Technologies, Incorporated, P. O. Box 85608, San Diego, California 92138). *Applied Physics Letters;* **43**: No. 10, 920-922(15 Nov 1983). Contract AT03-76ET51011.

Spatially and temporally resolved values of the ion temperature and toroidal rotation velocity near the plasma axis have been obtained in neutral beam-heated plasmas in the Doublet III tokamak from measurements of the Doppler broadening and Doppler shift of the He II 4686-A line, excited by charge transfer reactions between fast hydrogen atoms in the beam and thermal helium ions in the plasma. The measurement technique, which uses visible optics and a multichannel detector, promises to be a straightforward method to obtain ion temperature profiles in beam-heated tokamaks.

4086 **Particle lifetime scaling in field-reversed configurations based on lower-hybrid-drift resistivity.** Hoffman, A.L.; Milroy, R.D. (Mathematical Sciences Northwest, Inc., Bellevue, Washington 98004). *Physics of Fluids;* **26**: No. 11, 3170-3172(Nov 1983). Contract AC06-80ER53096.

The particle lifetime scaling for field-reversed configurations is derived in the limit where classical resistivity is negligible and anomalous resistivity is dominant. This scaling is shown to have the form tau/sub N/proportionalS$^4$(1+C/S)$^2$, where S is the ratio of the major radius to ion Larmor radius. The term in parentheses represents a contribution from open field line confinement which is very significant for present small-S field-reversed configurations since C has a typical value of 50. The open field line confinement only loses importance for reactor-sized plasmas with major radii approaching 1 m.

4087 **Quasilinear saturation effects on electron cyclotron wave damping of the ordinary mode in tokamak plasmas.** Fidone, I.; Meyer, R.L.; Granata, G. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 11, 3292-3299(Nov 1983). Contract AC02-76CH03073.

The quasilinear theory of electron cyclotron wave absorption for the ordinary mode propagating normal to the tokamak magnetic field is investigated. A two-dimensional initial value code has been developed to investigate the distortion of the electron momentum distribution from an initial Maxwellian. It is shown that for powers of interest for electron heating in future tokamaks, Coulomb electron collisions are not sufficient to avoid quasilinear flattening of the electron distribution; therefore, there is a reduction in the damping rate as compared to the linear case.

4088 **Linear and quasilinear theory of second electron cyclotron harmonic heating of tokamak plasmas.** Hsu, J.Y.; Chan, V.S.; McClain, F.W. (GA Technologies, Inc., San Diego, California 92138). *Physics of Fluids;* **26**: No. 11, 3300-3307(Nov 1983). Contract AT03-76ET51011.

Heating and current drive by electron cyclotron waves with the second harmonic resonance layer lying inside the plasma is studied. The full warm-plasma dispersion relation is solved numerically in a slab plasma model with assumed density and temperature profiles to study the scaling laws of heating, the spatial profiles of power deposition, and the rf-driven current. The current drive, via the anisotropic resistivity, is obtained analytically for weak rf within the Lorenz model and numerically from a Fokker—Planck code. Mode conversion from an ordinary mode to the extraordinary takes place at the incident angle of 35 deg. The allowed angular spread for efficient energy penetration is enhanced by a factor of 1.5 over that of the fundamental, and therefore makes this scheme workable and heating and current drive in high-density plasmas possible. The current drive efficiency is markedly improved when energy is damped through the electrostatic Bernstein mode.

4089 **Stability of equilibria with helical magnetic axis.** Mond, M. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physics of Fluids;* **26**: No. 11, 3327-3331(Nov 1983).

The stability of equilibria with a helical magnetic axis is studied. First, two families of equilibria whose applied fields have the same pitch as the magnetic axis are investigated. The two families differ from each other by the ordering of the physical variables with $\beta$. Then, the energy principle is used in order to check the stability properties of the equilibria. It is shown that low-$\beta$, low-shear systems with zero net current are stable for arbitrary values of the pressure if the deviation from straight magnetic axis is large enough.

4090 **Plasma heating with strong poloidal Ohmic currents.** Holly, D.J.; Prager, S.C.; Sprott, J.C. (University of Wisconsin, Madison, Wisconsin 53706). *Physics of Fluids;* **26**: No. 11, 3435-3439(Nov 1983).

The feasibility of using strong poloidal currents to heat plasmas has been examined experimentally in Tokapole II, operating as a toroidal octupole. The plasma resistivity ranges from that of Spitzer to about 1500 times Spitzer resistivity, as predicted by mirror-enhanced resistivity theory. This allows large powers (approximately 2 MW) to be coupled to the plasma at modest current levels. However, the confinement time is reduced by the heating, apparently due to a combination of the input power location (near the walls of the vacuum tank) and fluctuation-enhanced transport.

4091 **Viscosity-driven impurity transport in a stellarator.** Shaing, K.C. (Fusion Energy Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physics of Fluids;* **26**: No. 11, 3164-3167(Nov 1983). Contract W-7405-ENG-26.

The viscosity-driven impurity transport in a stellarator in the $1/\nu$ and collisionless detrapping regimes is calculated. It is found that the impurity flux tends to go inward radially if all the species are in the $1/\nu$ regime and tends to go outward if all the species are in the collisionless detrapping regime.

4092 **Scaling of oblique plasma double layers.** Borovsky, J.E. (Max-Planck-Institut fuer Aeronomie, D-3411 Katlenburg-Lindau 3, Federal Republic of Germany). *Physics of Fluids;* **26**: No. 11, 3273-3278(Nov 1983).

A systematic study of oblique nonlinear potential structures is presented. The results of particle-in-cell numerical simulations, numerical solutions to the Poisson—Vlasov equations, and Poisson—Vlasov theory all support Debye-length scaling.

4093 **Neoclassical flows and transport in nonaxisymmetric toroidal plasmas.** Shaing, K.C.; Callen, J.D. (Nuclear Engineering Department, University of Wisconsin-Madison, Madison, Wisconsin 53706). *Physics of Fluids;* **26**: No. 11, 3315-3326(Nov 1983). Contract AC02-80ER53104.

The moment equation approach to neoclassical transport theory has been generalized to nonaxisymmetric toroidal systems under the assumption of the existence of magnetic surfaces. In particular, the parallel plasma flows and bootstrap current are calculated in both the Pfirsch—Schlueter and banana regimes. It is found that both parallel plasma flows and the bootstrap current can be reduced as the toroidal bumpiness increases in an otherwise axisymmetric system.

4094 **Growth rate of the clump instability.** Tetreault, D.J. (Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physics of Fluids;* **26**: No. 11, 3247-3261(Nov 1983).

The instability of phase space density granulations or clumps has recently been reported. A theory for the growth rate of the clump instability in a one-dimensional, ion—electron plasma is presented. Growth is predicted to occur in regions of velocity space where the average particle distribution functions have opposing velocity gradients. The free energy required for instability is significantly below the threshold necessary for the linear instability of ion acoustic waves. The growth rate increases with fluctuation amplitude and is proportional to the inverse of the nonlinear trapping

time. The effect of particle discreteness and clump self-energy on the growth rate is discussed. The growth rate is in reasonable agreement with recent particle simulations.

4095 **Magnetic reconnection driven by the coalescence instability.** Bhattacharjee, A.; Brunel, F.; Tajima, T. (Institute for Fusion Studies, The University of Texas at Austin, Austin, Texas 78712). *Physics of Fluids;* **26**: No. 11, 3332-3337(Nov 1983). Contract FG05-80ET53088.

A detailed study of magnetic reconnection at an X point driven by the coalescence instability is presented. In particular, the effects of plasma compressibility and the magnitude of the toroidal field on the rate of reconnection are explored. For large toroidal fields, the plasma is almost incompressible and the destruction of magnetic flux proceeds linearly with time. However, when the attractive force between two neighboring islands is strong, and when the poloidal and the toroidal fields are comparable in magnitude, the reconnection rate is found to be faster. Implications for the steady-state models of magnetic reconnection are discussed.

4096 **Drift-wave turbulence with wave—wave and wave—particle nonlinear effects in a sheared slab.** Waltz, R.E.; Dominguez, R.R. (GA Technologies, Inc., San Diego, California 92138). *Physics of Fluids;* **26**: No. 11, 3338-3349(Nov 1983). Contract AT03-76ET51011.

Low-$\beta$ tokamaks have drift-wave density fluctuations (n/n) with the characteristics of strong turbulence. To describe their spectra, earlier work [Phys. Fluids 26, 169 (1983)] with simple wave—wave nonlinear coupling models in two dimensions is extended to more physical electrostatic models for drift waves in three dimensions. The electrons are treated with a linear nearly Boltzmann response. The cold ions have nonlinear cross-field drift motion and linear parallel motion. Numerical methods based on the direct interaction approximation are applied to both wave—wave and wave—particle nonlinear effects, and the spectral intensity I/sub k//sub x/k/sub y/k/sub parallel/$\omega$ [n/n = (rho/sub s//L/sub n/)I$^1$/sup //$^2$] for a sheared slab is calculated. The shear causes a linear coupling of adjacent k/sub x/ and k/sub parallel/ modes. A suggested extension to toroidal geometry is made. Many similarities with experiments are found: Iperpendicular is nearly isotropic in k/sub perpendicular/ and peaked at k/sub perpendicular/rho/sub s/ <O(1/3). Ion Compton scattering damps at large k/sub perpendicular/rho/sub s/ and parallel ion motion provides critical damping at low k/sub y/ rho/sub s/. Here I$^1$/sup //$^2$ ~O(3) is weakly dependent on the linear driving rate $\gamma$ and best summarized by the mixing length model: n/n~1/k/sub x/L/sub n/ with D~$\gamma$/k$^2$/sub x/.

4097 **Reduced magnetohydrodynamics and the Hasegawa—Mima equation.** Hazeltine, R.D. (Institute for Fusion Studies, The University of Texas at Austin, Austin, Texas 78712). *Physics of Fluids;* **26**: No. 11, 3242-3245(Nov 1983). Contract FG05-80ET53088.

Reduced magnetohydrodynamics consists of a set of simplified fluid equations which has become a principal tool in the interpretation of plasma fluid motions in tokamak experiments. The Hasegawa—Mima equation is applied to the study of electrostatic fluctuations in turbulent plasmas. The relations between these two nonlinear models is elucidated. It is shown that both models can be obtained from appropriate limits of a third, inclusive, nonlinear system. The inclusive system is remarkably simple.

4098 **Magnetic surface waves in plasmas.** Jones, R.D. (Applied Theoretical Physics Division, Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545). *Physical Review Letters;* **51**: No. 14, 1269-1271(3 Oct 1983).

The existence of a new type of surface wave in plasmas is demonstrated. These waves are intimately connected with the self-generation of magnetic fields in the laser-plasma interaction. The waves resemble waveguide modes in that a number of discrete modes can exist. The modes are localized to within a collisionless skin depth of the surface and, in the collisionless fluid limit, there is no restriction on the distance the waves can propagate.

4099 **Potentials in thermal barriers with strong electron-cyclotron heating.** Cohen, R.H. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physics of Fluids;* **26**: No. 10, 2774-2777(Oct 1983). Contract W-7405-ENG-48.

Expressions for the potential difference Phi/sub p/b between the plug and barrier regions of a tandem-mirror thermal barrier cell are derived in the limit of strong electron-cyclotron heating. It is found that Phi/sub p/b varies as the 2/3 power of the ratio of the density of electrostatically trapped plug electrons to the density of thermal electrons at the barrier. Electric-field requirements for validity of the solutions are presented.

4100 **Numerical solution of the electron distribution function in tandem-mirror thermal barriers.** Matsuda, Y.; Rognlien, T.D. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physics of Fluids;* **26**: No. 10, 2778-2780(Oct 1983). Contract W-7405-ENG-48.

The relativistic Fokker—Planck equation is solved with electron cyclotron resonance heating (ECRH) in a magnetic mirror for an assumed thermal barrier electrostatic potential profile. Two methods: a finite element technique and a Monte Carlo technique: give nearly the same results. Favorable comparison is made with recently obtained analytical expressions for the relation between axial density ratios and potential profile using parameters expected in the TMX-U and MFTF-B experiments.

4101 **Survey of free-boundary ion ring equilibria.** Ruchti, C.B. (Department of Applied Physics, Cornell University, Ithaca, New York 14853). *Physics of Fluids;* **26**: No. 10, 3092-3095(Oct 1983). Contract AC02-76ET53017.

A systematic survey is made of free-boundary, large-orbit ion ring equilibria for the case where the distribution function is narrowly peaked at a given value of the single-particle energy (H) and the canonical angular momentum (P/sub theta/). Suitably normalized, such equilibria depend on only two free parameters. The survey covers essentially all of the parameter space where field-reversed equilibria exist. Results are presented as contour plots in the (P-bar, H-bar) plane of various physical quantities. The results may be reinterpreted so as to apply to relativistic electron rings on which there are experimental observations.

4102 **Pulsed plasma source spectrometry in the 80—8000-eV x-ray region.** Henke, B.L.; Yamada, H.T.; Tanaka, T.J. (Department of Physics and Astronomy, University of Hawaii, Honolulu, Hawaii 96822). *Review of Scientific Instruments;* **54**: No. 10, 1311-1330(Oct 1983). Contract AS08-81DP40153.

The general characteristics are compared for the plane, convex, and concave fixed crystal analyzers which may be applied to the spectrometry of concentrated, intense plasma sources of x radiation involved, for example, in fusion energy and x-ray laser research. The unique advantages of the elliptical analyzer for precise and absolute spectral measurements are noted and detailed descriptions of its geometrical and physical optics are presented. With a source point at one of the foci of the elliptical analyzer profile, the spectrum is Bragg reflected ($45° < 2\theta < 135°$) at normal incidence upon a detection circle with its center at the second focal point, at which an effective scatter aperture and filter window is located. A primary monochromator consisting of a cylindrical, grazing-incidence mirror is placed between the source and the analyzer to provide an efficient cutoff for high-order diffracted background radiation and to focus the divergent rays so as to obtain an adjustable spectral line length at the detection circle. Photographic film may be transported along the detection circle. Linear position-sensitive electronic detection arrays or a streak camera slit window may be placed along a chord of the detection circle. Calibration procedures for absolute line and continuum intensity measurement are described and examples of calibrating spectra are presented as measured with elliptical analyzers of LiF, PET, KAP, and molecular multilayers for the 80—8000-eV photon energy region. The instrumental effects that contribute to the spectral line shape as measured by the elliptical analyzer spectrograph are defined and a simple

line-shape analysis procedure is presented for the determination of the line-broadening contributions of the source.

4103 **Plasma spectral analysis using an image dissecting detector.** Weber, P.G. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Review of Scientific Instruments;* **54**: No. 10, 1331-1333(Oct 1983).

We describe the adaptation of an image dissecting detector to a visible/near-ultraviolet radiation spectrometer used in laboratory plasma diagnostics. The detector has advantages in terms of sensitivity, fast scanning capability, and versatility over other detectors. We demonstrate several plasma diagnostics applications for the system.

4104 **Scanning microwave interferometer for ELMO bumpy torus.** Uckan, T. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Review of Scientific Instruments;* **54**: No. 10, 1420-1421(Oct 1983). Contract W-7405-ENG-26.

A simple 4-mm scanning microwave interferometer has been developed and employed for electron density profile measurements on the ELMO bumpy torus (EBT). By making use of a pair of horizontally moving 45° mirrors that are located at the top and bottom of the plasma volume, the system avoids the deleterious effects of plasma sputtering and wall material flaking, since the microwave transmission and receiving horns do not view the plasma directly.

4105 **Technique to increase the $H^+$ ion fraction in a multicusp source.** Ehlers, K.W.; Leung, K.N. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Review of Scientific Instruments;* **54**: No. 10, 1296-1299(Oct 1983). Contract AC03-76SF00098.

It is possible to filter out the primary ionizing electrons from the ion extraction region of a multicusp source by installing the filament inside the dipole fields of the permanent magnets and thereby enhance the $H^+$ ion species in the extracted beam. An optimum position of the filament has been determined such that a quiescent plasma together with a uniform plasma density profile across the extraction plane can be obtained.

4106 **Finite-larmor-radius magnetohydrodynamic equations for microturbulence.** Hasegawa, A.; Wakatani, M. (Bell Laboratories, Murray Hill, New Jersey 07974). *Physics of Fluids;* **26**: No. 10, 2770-2772(Oct 1983). Contract AC02-76ET53016.

A set of nonlinear fluid equations which includes the effect of finite ion Larmor radius is derived to describe microturbulence [k/sub perpendicular/ rho/sub s/ ≃O(1), k/sub parallel/R≃O(1), $n_1/n_0$≃ rho/sub s//L/sub n/, and $B_1/B_0$≃rho/sub s//R ] in an inhomogeneous plasma with a strong magnetic field of general geometry. Here rho/sub s/ is the ion Larmor radius at the electron temperature, L/sub n/ is the density gradient scale length, R is the radius of curvature of the magnetic line of force, k is the wave vector, and $n_1/n_0$ and $B_1/B_0$ are relative levels of density and magnetic field perturbations.

4107 **Electrostatic Kelvin—Helmholtz instability in a radially injected plasma cloud.** Sydora, R.D.; Wagner, J.S.; Lee, L.C.; Wescott, E.M.; Tajima, T. (Geophysical Institute, University of Alaska, Fairbanks, Alaska 99701). *Physics of Fluids;* **26**: No. 10, 2986-2991(Oct 1983). Contract FG05-80ET53088.

An electrostatic finite-sized particle simulation model is used to study the early time-scale phenomena associated with an impulsively injected plasma, expanding radially, normal to a strong ambient magnetic field. Results of the simulation show the early formation of a radial polarization electric field due to ion—electron charge separation which causes electrons to drift in the azimuthal direction. Velocity shear within this motion gives rise to a Kelvin—Helmholtz (diocotron) instability, creating a radial fluted pattern as the plasma expands. In the nonlinear stage of instability, azimuthal variations in the electric field are observed which cause electrons to drift across the magnetic field, thereby reducing the space charge created by energetic ion expansion. The results of a linear stability analysis reveal that for a decreasing amount of charge separation in the plasma, the number of unstable azimuthal modes at maximum growth rate increases. Also, as the thickness of the electron ring increases, a fewer number of unstable modes develops for a given amount of charge separation. It is concluded that electrons become unstable at the very early time scale, within an ion gyroperiod, and that unstable electrons lead to modification of the ion dynamics.

4108 **Weak cubic Langmuir turbulence.** Hansen, P.J.; Nicholson, D.R. (University of Iowa, Iowa City, Iowa 52242). *Physics of Fluids;* **26**: No. 10, 3008-3017(Oct 1983). Contract AC02-82ER53136.

The cubically nonlinear Schroedinger equation model of Langmuir turbulence is solved in the weak turbulence limit. Steady-state power-law solutions for the energy spectra are found in arbitrary dimensionality. In one spatial dimension, the theory incorrectly predicts that no spectrum evolves in time. In three spatial dimensions, numerical solutions are obtained for the undriven, undamped, initial value problem and for the driven, damped, initial value problem.

4109 **Space-time evolution of the beam-plasma instability.** Jones, M.E.; Lemons, D.S.; Mostrom, M.A. (Advanced Concepts and Plasma Applications Group Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physics of Fluids;* **26**: No. 10, 2784-2786(Oct 1983).

Particle-in-cell simulations of the beam-plasma instability confirm that the behavior of the interaction can be described as a wave packet that continually grows in both space and time. A consequence is that the energy deposition length of the instability becomes shorter in time, offering increased potential for this interaction to be used as an inertial fusion driver.

4110 **Parametric excitation of ion-sound quasimodes during lower-hybrid heating experiments in tokamaks.** Takase, Y.; Porkolab, M. (Department of Physics and Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physics of Fluids;* **26**: No. 10, 2992-3003(Oct 1983). Contract AC02-78ET51013.

Parametric decay of a lower-hybrid pump wave into another lower-hybrid wave and a low-frequency ion-sound quasimode (ω/sub R/roughly-equalk/sub parallel/v/sub t/i) is studied. Such an instability may be excited during high-power lower-hybrid heating experiments in tokamak plasmas and may lead to strong modification of the incident n/sub parallel/ spectrum near the plasma periphery. Such an instability could explain the broadened and downshifted frequency spectrum and phase-independent heating observed in the Alcator A tokamak experiments. Although the growth rate for this decay increases like $\gamma+\Gamma_2$proportional$E^2_0$ for powers slightly above threshold ($\Gamma_2$ is the linear damping rate at the lower sideband and $E_0$ is the pump electric field), for powers well above threshold (such that $\gamma >$ or ≃ω/sub R/)γproportionalE/sup 2/3/$_0$, and the convective thresholds are rather high. However, for inaccessible n/sub 0parallel/, the pump wave power is expected to accumulate on the outer surface of the plasma column where the growth rate is large and the convective thresholds are significantly reduced. In such a case the threshold pump power can become quite low and may be exceeded in experiments such as Alcator A.

4111 **Ballooning modes in quadrupole tandem mirrors.** Kaiser, T.B.; Pearlstein, L.D. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physics of Fluids;* **26**: No. 10, 3053-3065(Oct 1983). Contract W-7405-ENG-48.

Ballooning modes in tandem mirrors with quadrupole vacuum field symmetry are investigated in the limits of zero gyroradius and large aspect ratio. The eigenmode equation derived from the guiding-center energy principle is reduced to one dimension by the use of an eikonal representation of the cross-field variation of the perturbation. The eigenvalue problem is solved numerically and the structure of the local dispersion relation examined in order to derive conditions for marginal stability. Applications to the TMX-U and MFTF-B tandem-mirror experiments are presented.

4112 **Application of the stellarator expansion for plasma stability studies in stellarators.** Anania, G.; Johnson, J.L. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 10, 3070-3078(Oct 1983). Contract AC02-76CH03073.

A numerical code, which utilizes the stellarator expansion, is developed and tested. It is used to investigate the magnetohydrodynamic stability properties of several stellarator configurations, including Heliotron E, Wendelstein VII-A, a modular-coil device, and ATF-1.

4113 **Anisotropic pressure and finite hot-electron Larmor radius effects on hot-electron ring stability.** Tsang, K.T.; Lee, X.S.; Catto, P.J. (Science Applications, Inc., Plasma Research Institute, Boulder, Colorado 80302). *Physics of Fluids;* **26**: No. 10, 3079-3084(Oct 1983). Contract AC03-76ET53057.

The effect of the anisotropic pressure of a hot-electron plasma on ballooning-interchange and compressional-Alfven modes is investigated. General eigenmode equations for these modes are derived in the eikonal and high phase velocity limits with finite gyroradius effects retained. A local dispersion relation is obtained in the flute limit for an isotropic Maxwellian background plasma with a bi-Maxwellian hot-electron population. Stability is investigated both analytically and numerically for this high phase velocity and/or high precessional frequency model.

4114 **Role of the hot-electron distribution function in the stability of the ELMO Bumpy Torus.** Nguyen, K.; Kammash, T. (The University of Michigan, Ann Arbor, Michigan 48109). *Physics of Fluids;* **26**: No. 10, 3085-3091(Oct 1983).

Several recent studies of ELMO Bumpy Torus (EBT) stability show that conflicting results can emerge when different distribution functions for the hot-electron component are used. In this paper the role of the distribution function is established by examining the stability of various modes with the aid of two models. In the "slab" model where the magnetic field curvature is simulated by a gravitational force it is shown that the stability of the compressional Alfven wave is insensitive to the distribution function while the interacting interchange mode is sensitive. In the "local" approximation in which the curvature effects enter in a natural way it is seen that the interchange modes are insensitive so long as the anisotropy of the hot electrons is large, while other modes reflect dependence on the distribution function. Finally it is demonstrated that in the "deep well' case the results for both modes are independent of the model and of the distribution function.

4115 **Rayleigh—Taylor instability in an inhomogeneous ablatively accelerated fluid.** Colombant, D.G.; Manheimer, W.M. (Plasma Physics Division, Naval Research Laboratory, Washington, DC 20375). *Physics of Fluids;* **26**: No. 10, 3127-3130(Oct 1983).

The reduction in Rayleigh—Taylor instability growth rate because of density inhomogeneity in an incompressible ablatively accelerated plasma is calculated over a very wide range of physical parameters. In the low-wavenumber regime, the effect of the density gradient is to give a significant (about a factor of 2) reduction in growth rate as seen in fluid simulations.

4116 **Echo phenomenon associated with lower-hybrid wave launching.** Wong, K.L.; Skiff, F.; Ono, M. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 10, 2772-2774(Oct 1983). Contract AC02-76CH03073.

Lower-hybrid waves at two different frequencies $f_1$ and $f_2$ are launched simultaneously from two localized antennas, and a third wave is observed to arise near the plasma edge at the frequency $f = f_2 - f_1$. This phenomenon can be explained by an echo effect near the plasma surface.

4117 **Theory of mode-induced beam particle loss in tokamaks.** White, R.B.; Goldston, R.J.; McGuire, K.; Boozer, A.H.; Monticello, D.A.; Park, W. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 10, 2958-2965(Oct 1983). Contract AC02-76CH03073.

Large-amplitude rotating magnetohydrodynamic modes are observed to induce significant high-energy beam particle loss during high-power perpendicular netural beam injection on the poloidal divertor experiment (PDX). A Hamiltonian formalism for drift orbit trajectories in the presence of such modes is used to study induced particle loss analytically and numerically. Results are in good agreement with experiment.

4118 **Analytical approximations for the electron cyclotron absorption coefficient at the fundamental frequency in the Doppler regime.** Celata, C.M. (Physics Department, Dartmouth College, Hanover, New Hampshire 03755). *Physics of Fluids;* **26**: No. 10, 3029-3037(Oct 1983).

The index of refraction and the electron cyclotron absorption coefficient at ωroughly-equalo/sub c/ in the Doppler regime are examined for a plasma in thermal equilibrium. Regimes where the known analytical approximations fail are quantitatively delineated. The exact numerical solution to the dispersion relation is given in the regimes where known analytical theory fails.

4119 **Ballooning mode spectrum in general toroidal systems.** Dewar, R.L.; Glasser, A.H. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 10, 3038-3052(Oct 1983). Contract AC02-76CH03073.

A WKB formalism for constructing normal modes of short-wavelength ideal hydromagnetic, pressure-driven instabilities (ballooning modes) in general toroidal magnetic containment devices with sheared magnetic fields is developed. No incompressibility approximation is made. A dispersion relation is obtained from the eigenvalues of a fourth-order system of ordinary differential equations to be solved by integrating along a line of force. Higher-order calculations are performed to find the amplitude equation and the phase change at a caustic. These conform to typical WKB results. In axisymmetric systems, the ray equations are integrable, and semiclassical quantization leads to a growth rate spectrum consisting of an infinity of discrete eigenvalues, bounded above by an accumulation point. However, each eigenvalue is infinitely degenerate. In the nonaxisymmetric case, the rays are unbounded in a four-dimensional phase space, and semiclassical quantization breaks down, leading to broadening of the discrete eigenvalues and the accumulation point of the axisymmetric unstable spectrum into continuum bands. Analysis of a model problem indicates that the broadening of the discrete eigenvalues is numerically very small, the dominant effect being broadening of the accumulation point.

4120 **Reduced equations for internal kinks in tokamaks.** Izzo, R.; Monticello, D.A.; Strauss, H.R.; Park, W.; Manickam, J.; Grimm, R.; DeLucia, J. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 10, 3066-3069(Oct 1983). Contract AC02-76CH03073.

A reduced set of ideal magnetohydrodynamic equations is derived for large-aspect-ratio, low-$\beta$ tokamaks that adequately describes the linear and nonlinear evolution of ideal internal kink modes in tokamaks.

4121 **Dispersion relation for a relativistic electron beam in a plasma.** Shoucri, M. (Production et Conversation d'energie, Institut de Recherche d'Hydro-Quebec, Varennes J0L 2P0, Quebec, Canada). *Physics of Fluids;* **26**: No. 10, 3096-3097(Oct 1983).

The dispersion relation for a relativistic electron beam in a plasma, in the absence of an external magnetic field, is derived. It is shown that the plasma oscillations excited by the beam are linearly coupled to the electromagnetic TM mode.

4122 **Inhomogeneous two-plasmon instability.** Simon, A.; Short, R.W.; Williams, E.A.; Dewandre, T. (Laboratory for Laser Energetics, University of Rochester, Rochester, New York 14623). *Physics of Fluids;* **26**: No. 10, 3107-3118(Oct 1983). Contract AC08-80DP40124.

The two-plasmon instability in warm inhomogeneous plasma for a normally incident pump is considered. The complex eigenfrequencies of the absolute instability are obtained by reducing the linearized fluid equations to a Schroedinger equation in wavenumber space. These eigenvalues are obtained in several ways. One is by combining a perturbation expansion in powers of the reciprocal scale length with WKB theory. The resulting algebraic equations are solved by three analytical approximations and by direct numerical solution. A second way is by analysis of the Schroedinger equation using an interactive WKB computer code. A third way is by the use of a shooting code. These methods are all used and compared for threshold curves and growth rates above threshold. Some eigenfunction forms are also obtained. The threshold is near ($v_0$/v/sub e/)$^2$$k_0$ L = 3, and varies weakly with $\beta \simeq v^4$/sub e//$v^2{}_0c^2$, rising from near 2 to about 4 over six decades of variation of $\beta$. The corresponding critical value of (k/sub y//$k_0$)$^2$ is near 0.2/$\beta$ over this range. Above threshold, there is a smooth variation of the growth rate with (k/sub y//$k_0$)$^2$, peaking at some intermediate value. The perturbation method is in good agreement there with more exact calculations. Experimental implications of these results are discussed.

4123 **Stimulated Brillouin backscattering in long-scale-length plasmas.** Colombant, D.G.; Manheimer, W.M.; Gardner, J. (U. S. Naval Research Laboratory, Washington, DC 20375). *Physics of Fluids;* **26**: No. 10, 3148-3155(Oct 1983).

Stimulated Brillouin backscattering in long-scale-length plasmas is calculated using a wave kinetic model. In these calculations use is made of computed hydrodynamic profiles for these plasmas. Results are presented for the parameters of the joint Naval Research Laboratory—Lawrence Livermore National Laboratory experiments and for reactor size pellets of 5 mm characteristic length. Means of reducing high levels of backscattering for the latter case are investigated.

4124 **Experimental study of high-beta tokamak stability.** Machida, M.; Navratil, G.A. (Columbia University, New York, New York 10027). *Physical Review Letters;* **51**: No. 11, 992-995(12 Sep 1983). Contract AC02-76ET53016.

The stability properties of high-beta tokamak equilibria with $\epsilon\beta$/sub p/$>$ or $\simeq 1$ and $<\beta>$ in the range of 10% have been studied with use of a dual-beam $CO_2$-laser interferometer system. Two equilibria with $<\beta>$ of 9% and 13% were observed to be stable. Another equilibrium with $<\beta>$ of 10% was observed to be unstable with the characteristics of a high—toroidal-mode-number ballooning mode.

4125 **Instability of fusing plasmas and spin-depolarization processes.** Coppi, B.; Pegoraro, F.; Ramos, J.J. (Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physical Review Letters;* **51**: No. 10, 892-895(5 Sep 1983).

A plasma mode driven by the anisotropy of the velocity distribution of charged fusion-reaction products can resonate with the spin precession frequency of one of the plasma components. When these spins are initially polarized, resonant depolarization can occur at a rate considerably faster than the fusion reaction rate, if spatial inhomogeneity effects do not depress excessively the mode amplitude.

4126 **Nonlinear coupling of drift waves, convective cells, and magnetic drift modes in finite-$\beta$ plasmas.** Rahman, H.U.; Weiland, J. (Institute for Electromagnetic Field Theory and EURATOM Fusion Research (EUR-EFN), Chalmers University of Technology, S-41296 Goeteborg, Sweden). *Physical Review [Section] A: General Physics;* **28**: No. 3, 1673-1678(Sep 1983).

A set of three coupled nonlinear equations describing electrostatic drift waves, drift Alfven waves, convective cells, and magnetic drift modes has been derived for finite ion temperature. The reduction to simplified nonlinear model equations in different $\beta$ regimes and the consequences for transport properties are discussed.

4127 **Direct implicit large time-step particle simulation of plasmas.** Langdon, A.B.; Cohen, B.I.; Friedman, A. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Journal of Computational Physics;* **51**: No. 1, 107-138(Jul 1983). Contract W-7405-ENG-48.

A recently developed implicit method for solving the set of coupled particle and field equations arising in particle-in-cell plasma simulation is described in detail. This implicit integration scheme is motivated by the desire to study efficiently low-frequency, long-wavelength plasma phenomena using a large time step. In particular, this method allows the use of a time step which larger than the electron plasma period, when electron plasma oscillations are not of interest, and provides selective damping of the distorted remnant of the electron plasma oscillation. The implicit scheme presented here uses particle data directly without introducing fluid moment equations as an intermediary between the field and particle equations. In an electrostatic model, the essence of our scheme is a linearization of the charge density at the advanced time about an explicit approximate density and the computation of the incremental correction to the charge density that is linear in the advanced field. We are led to an elliptic field equation whose coefficients depend directly on particle data accumulated on the spatial grid in the form of an effective linear susceptibility. Prediction and iterative refinement of the solution of the implicit equations, and spatial difference representations of the equations are given. Residual restrictions on time step are described. It is demonstrated that convergence is superior when spatial differencing and filtering are done in a consistent manner.

4128 **Absorption of radiation propagating obliquely in a magnetoplasma.** Khandker, A.; O'Connell, R.F.; Ford, G.W. (Department of Physics and Astronomy, Louisiana State University). *Astrophysical Journal;* **269**: No. 2, 668-670(15 Jun 1983). Contract AS05-79ER10459.

We consider the propagation of electromagnetic radiation in a magnetoplasma, with the propagation vector making an arbitrary and $\theta$ with respect to the magnetic field, and we obtain a general expression for the power absorbed. In the particular case of propagation of circularly polarized radiation, we find that, for all angles, left circularly polarized radiation is absorbed more than right circularly polarized radiation. We discuss the implications of our results for the deduction of the magnitude of the magnetic field in magnetic white dwarfs.

4129 **Computations in plasma physics.** Cohen, B.I.; Killeen, J. (Lawrence Livermore National Laboratory). *Physics Today;* **36**: No. 5, 54-63(May 1983). Contract W-7405-ENG-48.

Computers of all sizes are assisting in theoretical calculations of increasing sophistication and precision, and in the design, direction and analysis of experiments.

4130 **Order of the linear instability of a plasma.** Larsen, E.W.; Burnap, C.; Zweifel, P.F. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Transport Theory and Statistical Physics;* **12**: No. 1, 73-79(Jan 1983). Contract AS05-80ER10711.

We derive a simple condition that determines the order, in perturbation theory, of the linear instability of a plasma.

4131 **High-power ICRF and ICRF plus neutral-beam heating on PLT.** Hwang, D.; Bitter, M.; Budny, R. (Princeton Univ., NJ (USA). Plasma Physics Lab.). pp 3-15 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/I-1).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

PLT ICRF experiments with RF powers up to approx.=3 MW have demonstrated efficient plasma heating in both the minority fundamental and the second harmonic ion-cyclotron regimes. In the minority $^3$He regime, ion temperatures of approx.=3 keV have been produced along with approx.=1 kW of D-$^3$He fusion power and substantial electron heating. In the second harmonic H regime, an equivalent averaged ion energy of approx.=4 keV has been achieved. Combined ICRF plus neutral-beam heating experiments with auxiliary powers totalling up to 4.5 MW have provided insight into auxiliary heating performance at stored plasma energy levels up to approx.=100 kJ. Values of $\beta$sub(phi) in the range of 1.5-2% have been attained for Bsub(phi) approx.=17 kG. Energetic discharges with n-barsub(e) up to approx.6x10$^{13}$ cm$^{-3}$ at Bsub(phi) approx.=28 kG have also been investigated. Preliminary confinement studies suggest that energetic ion losses may contribute to a direct loss of the input RF power in the H minority heating regime but are insignificant in the $^3$He minority case. The energy confinement time for the H minority regime is reduced somewhat from the Ohmic value.

4132 **Equilibrium, stability and heating of plasmas in linear and toroidal Extrap pinches.** Bonnevier, B.; Drake, J.R. (Royal Inst. of Tech., Stockholm (Sweden)); Dalhed, H.E. (Lawrence Livermore National Lab., CA (USA)). pp 135-141 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/J-5).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

The Extrap scheme consists of a Z-pinch immersed in an octupole field. The total magnetic field has no component along the pinch axis. Globally stable Z-pinch equilibria with a distributed plasma current density and a duration of about 100 Alfven transit times have been observed in linear and toroidal sector experiments. Theoretical studies indicate that this stability can be the result of constraints introduced by the octupole field and the resulting separatrix of the total field, in combination with finite-Larmor-radius effects. A scheme for ICRF heating of the plasma in configurations with a magnetic neutral line, being applicable to Extrap and FRC, is analysed. Wave propagation arises owing to the Hall effect. Particle resonances are responsible for the absorption, owing to a high parallel wavenumber and a weak magnetic field.

4133 **High-beta neoclassical current and stability experiments.** Callen, J.D.; Dexter, R.N.; Fortgang, C.M. (Wisconsin Univ., Madison (USA). Dept. of Physics). pp 143-150 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/J-6).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

Equilibrium neoclassical plasma currents and plasma stability at high values of beta have been studied in the Levitated Toroidal Octupole. In a collisionality regime at the border between the banana and plateau regimes, the bootstrap and Pfirsch-Schlueter currents have for the first time been experimentally observed in agreement with neoclassical theory. Also, stable plasmas have been produced with extremely high beta values (2.5 times the MHD ballooning instability beta limit) and compared with the results of a kinetic stability calculation, implicating finite-ion-gyroradius effects as a possible cause for the observed stability. To augment both the bootstrap current and stability studies, four megawatts of ion cyclotron resonance heating power are being optimized.

4134 **Fusion reactor plasmas with polarized nuclei.** Kulsrud, R.M.; Furth, H.P.; Valeo, E.J.; Budny, R.V.; Jassby, D.L.; Micklich, B.J.; Post, D.E. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Goldhaber, M. (Brookhaven National Lab., Upton, NY (USA)); Happer, W. (Princeton Univ., NJ (USA)). pp 163-173 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/K-2).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

New techniques of bulk polarization could be used to fuel a reactor with polarized hydrogenic atoms so as to form a plasma of polarized nuclei. Theoretical calculations indicate that, once the nuclei of the plasma are polarized in some preferred state, they can maintain this state with a probability near 100% during their lifetime in the reactor, including possible recycling. There are a number of practical advantages to be gained from the use of polarized plasma in a fusion reactor. The nuclear reaction rates can be increased or decreased and/or the direction of emission of the reaction products can be controlled. The D-T reaction rate can be enhanced by as much as 50%, with the reaction products emitted perpendicular to the magnetic field. Alternatively, it is possible to direct the reaction products primarily along the field, with no enhancement. In the case of the D-D reaction, the theoretical predictions are somewhat less certain. Enhancement of the reaction rate by a factor of 1.5 to 2.5 is to be expected. In a different polarization state, suppression of D-D reactions may be feasible - a possibility that would be of interest for a "neutron-free" D-$^3$He reactor. A quantitative discussion of the relevant nuclear physics as well as of the various mechanisms producing depolarization is given.

4135 **Curvature-driven trapped-particle modes in tandem mirrors.** Berk, H.L.; Rosenbluth, M.N. (Texas Univ., Austin (USA). Inst. for Fusion Studies); Wong, H.V. (Texas Univ., Austin (USA). Fusion Research Center); Antonsen, T.M. Jr. (Maryland Univ., College Park (USA). Dept. of Physics and Astronomy); Baldwin, D.E. (Lawrence Livermore National Lab., CA (USA)); Lane, B. (Massachusetts Inst. of Tech., Cambridge (USA)). pp 175-182 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/K-3).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

The variational structure of the plasma linear response function is used to demonstrate the relation of magnetohydrodynamic (MHD) and trapped-particle instabilities. Although in most systems, where bending energy stabilizes ballooning modes, trapped-particle instabilities have a low growth rate, in tandem mirrors with thermal barriers the trapped-particle instability growth rate can approach that of MHD instabilities. In addition, the kinetic theory yields stabilizing effects due to the difference in electron and ion orbits and destabilizing effects due to the variation of the E-vector x B-vector drift along a field line.

4136 **Plasma properties and ion heating in EBT-S and hot electron rings at TRW.** Baity, F.W.; Berry, L.A.; Bighel, L. (Oak Ridge National Lab., TN (USA)). pp 185-196 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/L-1).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

The ELMO Bumpy Torus-Scale (EBT-S) has been heated by up to 200 kW of 28-GHz microwave power. Application of this

power has greatly extended the operating regime of interest and has allowed scaling over a wider range of plasma temperature and density. Electron temperatures of about 1 keV have been reached at densities of 0.5-2x10$^{18}$ m$^{-3}$. Electron confinement is approximately classical, with tausub(E) approx.= 2-5 ms. Impurity densities are low, and impurity radiation represents a negligible power loss. Ion heating has been observed with RF in the range 15-50 MHz. High-$\beta$ electron rings provide MHD stability to EBT-S. Measured values of the energy loss agree with calculated values to within a factor of 4, which is within the combined error limits of the calculations and other observations. Multiple-frequency ring formation has been studied in the simple mirror device SM-1, and with this technique four-fold increases in the ring stored energy have been observed. These results have been extended in the five-cell STM-1 device to include the formation of hot electron discs and ring-disc combinations. In addition, ion-cyclotron heating of a streaming plasma has been shown to give a large increase in the stored energy in STM-1.

4137 **Experimental studies of field-reversed configuration confinement in FRX-C.** Siemon, R.E.; Armstrong, W.T.; Bartsch, R.R. (Los Alamos National Lab., NM (USA)). pp 283-292 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/M-2-1).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

A primary purpose of the large-bore (0.5 m dia.) FRX-C field-reversed theta-pinch experiment is to study the scaling of plasma particle containment time tausub(N) with major radius R of the field-reversed configuration (FRC). At 20 mtorr fill pressure the FRX-C plasma parameters, n-bar approx.=4x10$^{15}$ cm$^{-3}$, Tsub(e) approx.=100 eV, Tsub(i) approx.=150 eV, are comparable to those obtained in the smaller bore (0.25 m dia.) FRX-B device. Under these conditions, the present measurement of particle confinement time in FRX-C is tausub(N) approx.=140 $\mu$s, consistent with the scaling tausub(N) is proportional to R$^2$, when compared with the earlier FRX-B results. This favourable scaling has been observed with R/rhosub(i) approx.=30 (rhosub(i)=ion gyroradius), twice as large as in FRX-B, despite theoretical indications that various MHD instabilities would appear as R/rhosub(i) was increased. The characteristics of hotter neutron-generating FRC plasma produced at lower fill pressure (5 mtorr), where n-bar approx.=2x10$^{15}$ cm$^{-3}$, Tsub(e) approx.=170 eV, Tsub(i) approx.=600 eV, are also presented. In this plasma regime an accurate determination of tausub(N) is difficult because of the short stable period observed.

4138 **High-beta tokamak plasma physics studies.** Chu, C.K.; Deniz, A.V.; Elkin, D.J. (Columbia Univ., New York (USA). Plasma Physics Lab.). pp 321-329 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/M-5-1).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

Experimental and theoretical research at Columbia University on the physics of high-beta tokamaks is summarized. Data obtained from multipoint Thomson scattering and multichannel magnetic probes show $\beta_0$ approx.=42%, $<\beta>$ approx.=13%, nsub(e)(0) approx.=2x10$^{21}$ m$^{-3}$, and Tsub(e) approx.=80 eV. A toroidal diamagnetic well is clearly observed as well as an outward shift in the peak of the pressure profile, amounting to 40% of the minor radius and indicating epsilon$\beta$sub(p)>1. Growing density fluctuations characteristic of low-n MHD instability are observed on the outer (large major radius) edge of the pressure profile. Spectroscopic measurements of poloidal and toroidal flows indicate a velocity of about 1.6x10$^6$ cm.s$^{-1}$ in each direction. Simulation of the formation and equilibrium of Torus II are described, as well as a more general treatment of high-beta tokamak stability from bifurcation theory.

4139 **Theory and simulation of RF heating and current drive.** Dawson, J.M.; Fried, B.D.; Morales, G.J.; Lin, A.T.; Decyk, V.K.; Caplan, M. (California Univ., Los Angeles (USA). Dept. of Physics). pp 595-602 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (IAEA-CN—41/V-9; CONF-820930—).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

Four topics in RF heating and current drive are discussed. (1) Single-particle ICRH in a strongly inhomogeneous magnetic field, with constant inverse scale length of order of the ion cyclotron radius was studied. Because the ion cyclotron frequency is energy-dependent, there is no time-averaged energy gain unless the RF field amplitude exceeds a critical value Esub(c), above which the multiple resonances, arising from the anharmonicity of the motion, overlap, resulting in stochastic heating. (2) An extraordinary ECRH wave launched from the high field side with large angle of incidence is observed to convert completely into a backward electrostatic Bernstein wave at the upper hybrid layer. The mode-converted wave deposits its energy to the electrons at the electron cyclotron layer through resonant interactions dominated first by the Doppler broadening and later by the relativistic mass correction. (3) An electrostatic particle simulation code is used to study heating and current generation with lower-hybrid waves. The heating simulations are designed to examine the propagation of lower-hybrid waves with finite amplitude in an inhomogeneous medium and the mechanisms by which wave energy is absorbed. The current drive simulations examine the dynamics of current generation for a given initial electron velocity distribution and antenna profile. (4) To model gyrotron oscillators and amplifiers, an adaptation of a 1-2/2D finite-size particle code has been developed which allows interaction circuits with arbitrary wall profiles. The code was used to design and analyse a 60 GHz 270 kW gyrotron oscillator built by Hughes Aircraft Co. for ECRH heating of plasmas. Good agreement was obtained between simulation and experiment.

4140 **Stellarator, hybrid stellarator, torsatron and low-shear stellarator studies.** Anania, G.; Grimm, R.C.; Ho, D. (Princeton Univ., NJ (USA). Plasma Physics Lab.). pp 603-612 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (IAEA-CN—41/V-10; CONF-820930—).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

(I) Equilibrium and stability studies using the stellarator expansion: the stellarator expansion reduces the three-dimensional MHD equations to two-dimensional ones and is applied to a model of Heliotron E. (II) Electron transport studies using the stellarator expansion: the stellarator expansion makes possible an estimate of "superbanana" electron heat transport. (III) Toroidal stellarator equilibria: it is shown how the vertical field, which produces no net body force, can shift vacuum flux surfaces and centre an equilibrium. (IV) Ballooning-mode equations for stellarators: ideal MHD ballooning-mode equations are derived for stellarators in the stellarator expansion. (V) Numerical studies of zero-net-current torsatrons: a fully three-dimensional computer code, based on an ideal MHD model, has been used to find stellarator configurations with finite critical values of the plasma parameter $\beta$. (VI) Low-shear stellarator studies: configurations whose magnetic axes are three-dimensional curves are studied; low-shear systems are considered for which the equilibrium and stability equations are simple; systems which have applied helical fields such as the Wendelstein stellarator are studied as well as configurations in which the rotational transform arises from geometry such as the figure-eight stellarator (in both cases families of equilibria are found, some of which are shown to be stable).

4141 **Theory of transport and heating in EBT.** Hedrick, C.L.; Batchelor, D.B.; Chen, G.L. (Oak Ridge National Lab., TN (USA)). pp 613-622 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (IAEA-CN—41/V-11; CONF-820930—).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

Recent developments in neoclassical transport theory and heating for EBT are presented. The development of improved analytic expressions for both electron and ion transport coefficients is summarized as is their effect on the self-consistent ambipolar electric field. These new results lead to significant improvements in the comparison of theory and experiment. Detailed calculations of Electron Cyclotron Heating (ECH) in existing EBT devices which include wave absorption by the relativistic rings are discussed. Preliminary studies of Ion Cyclotron Heating (ICRH) are also presented. For both transport and heating theory, topics for further theoretical concentration are suggested.

4142 **Fully ionized and total silicon abundances in the Alcator-C tokamak.** Petrasso, R.; Seguin, F.H.; Loter, N.G.; Marmar, E.; Rice, J. (American Science and Engineering, Incorporated, Cambridge, Massachusetts 02139). *Physical Review Letters;* **49**: No. 25, 1826-1829(20 Dec 1982). Contract AC02-77ET53068;AC02-78ET51013.

With use of x-ray imaging arrays, spatially and temporally resolved measurements were made of fully ionized and total absolute Si (Z = 14) densities following injection of Si into Alcator C. The fully stripped ions were detected through x rays resulting from ground-state radiative recombination. Central ion densities were found to be close to coronal equilibrium values. In addition, radial profiles of fully ionized and H-like Si showed large fluctuations during internal disruptions. .ID LX2087 .PG 1830 1833

4143 **Use of sharp autoionizing resonances for soft x-ray diagnosis of inertially confined fusion plasmas.** Rhodes, C.K.; Carman, R.L. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Applied Optics;* **21**: No. 21, 3799-3800(1 Nov 1982).

Sharp autoionizing resonances (in this paper from He) used in conjunction with a spectrally bright XUV source of moderate power, e.g., laser produced plasma can greatly facilitate the coronal diagnostics of dense, high temperature, inertially confined fusion plasmas. (AIP)

4144 **Imaging x-ray spectrometer for laser fusion applications.** Ceglio, N.M.; Hawryluk, A.M.; Price, R.H. (University of California, Lawrence Livermore National Laboratory, P. O. Box 808, Livermore, California 94550). *Applied Optics;* **21**: No. 21, 3953-3960(1 Nov 1982).

A gold transmission grating has been coupled to a high-resolution Wolter-design grazing-incidence reflection x-ray microscope to produce an imaging x-ray spectrometer of unprecedented spatial resolution, spectral range, and collection solid angle. In a series of test experiments conducted at 1.75—2 keV, the instrument demonstrated a spectral resolving power, $\lambda/\Delta\lambda$, of 200 and a 1-D spatial resolution of 1 μm. The spectrometer's large collection solid angle, $\sim 2 \times 10^{-5}$ sr, and broad spectral range, from the near UV to 3.2 keV, make it a very versatile instrument for laser-fusion applications.

4145 **Neutral beam injector performance on the PLT and PDX tokamaks.** Schilling, G.; Ashcroft, D.L.; Eubank, H.P.; Grisham, L.R.; Kozub, T.A.; Kugel, H.W.; Rossmassler, J.; Williams, M.D. (Princeton Univ., NJ (USA). Plasma Physics Lab.). pp 967-974 of Fusion technology 1980. Vol. 2. Oxford, England; Pergamon Press (1981). (CONF-800950—Vols.1,2; EUR—7035).

From 11. symposium on fusion technology; Oxford, UK (15 Sep 1980).

In two volumes.

Beams of fast neutral atoms injected into initially cold target plasmas have aided in the study of the properties of hot confined plasmas approaching reactor-like conditions. Neutral beam injection has been used as a plasma heating tool on the PLT tokamak for about three years now, resulting in a plasma ion temperature of 7 keV, above the minimum reactor ignition requirement, and driving the bulk plasma deep into the collisionless reactor-like regime. Injection heating has been applied to plasmas in the PDX tokamak, starting in March 1980. The parallel conditioning and shakedown procedures of the first two injectors and the tokamak discharges are now yielding initial information.

4146 **Thermal consequences of plasma disruptions in TFTR and ETF.** Budny, R.; Ludescher, C. (Princeton Univ., NJ (USA). Plasma Physics Lab.). pp 1073-1077 of Fusion technology 1980. Vol. 2. Oxford, England; Pergamon Press (1981). (CONF-800950—Vols.1,2; EUR—7035).

From 11. symposium on fusion technology; Oxford, UK (15 Sep 1980).

In two volumes.

We studied thermal responses of first walls for TFTR and ETF during plasma disruptions. To model the flux, we assumed the entire kinetic energy is deposited by axisymmetric horizontal displacement of the plasma. The deposition time is a free parameter. In TFTR, the minimum deposition time which does not cause the toroidal limiter to melt is 7 or 14 ms depending on whether or not the limiter is actively cooled. In ETF, the minimum time which does not cause surface melting of the cooling tubes is 80 ms.

4147 **(CEA-N—2338) Transport and energy deposition of alpha particles. Fokker-PLanck equation treatment.** Besnard, D. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Dec 1982. 128p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE84700013.

We consider classical plasmas, where the background distributions are Maxwellian, in order to couple our study of fast ions transport with existing hydro codes, specially tailored to handle ICF simulations. We first study diffusion type approximations for the Fokker-Planck equation and discuss its ability to reproduce numerical results given by direct integration of the F.P. equation. We show results for transparent plasmas which is the worst possible case. It appears that these approximations give results in qualitatively good agreement with exact results, but that we need a more sophisticated treatment of the boundary conditions. We present particle simulation for solving the hyperbolic part of the F.P.E., coupled by a splitting with the other part of the equation. This remaining parabolic equation is solved with a standard finite differences scheme. This method was developped in order to enhance the utility of classical kinetic ions transport codes, we mean we designed it to be applicable to more demanding situations, such as transport in non homogeneous plasmas, and can be coupled to hydro transport codes. Economy requires that large differences of temperature and spatial gradient lengths can be represented with a minimum of zones and computational complexity. In the same way, it is likely that the algorithm reproduces important limiting cases and preserves gross conservation properties even with coarse zoning or large time steps. Results are very accurate and we have to insist on the fact that it is impossible in certain cases to neglect the velocity diffusion term of the F.P.E.

4148 **(CLM-R—226) Predicted behaviour of the single-null divertor of INTOR.** Harrison, M.F.A.; Hotston, E.S. (UKAEA Culham Lab., Abingdon). Sep 1982. 24p. HMSO, London, price Pound 2.00.

The performance of the single-null divertor is modelled over a range of scrape-off plasma parameters in the INTOR Phase I and Phase IIA. The behaviour of beryllium and tungsten is compared. The models predict that the DT plasma within the divertor chamber is cooled by localised recycling and that most of the energy which flows into the chamber is eventually deposited upon the target by convective transport through the sheath. Catastrophic

sputtering of a tungsten target is possible but unlikely. The temperature of the plasma at the sheath edge and also the effective sputtering of impurity atoms are sensitive to the plasma density in the scrape-off region. Increasing the scrape-off density to about 8 x $10^{19}$ $m^{-3}$ ensures that the effective sputter yield of tungsten does not exceed approximately $10^{-4}$. For a tungsten target the speed of the vacuum pumps needed to maintain 5% of helium within the scrape-off plasma is predicted to be about 150 $m^3$ $s^{-1}$ at 300K. A beryllium target almost doubles the pumping requirements. It is concluded that tungsten should be the recommended target material for the divertor of INTOR. Target lifetime and plasma purity could be enhanced by operating the scrape-off plasma at a density in excess of the specified value, ie $> 5 \times 10^{19}$ $m^{-3}$.

4149 **(CLM-R—230) Ripple transport in INTOR.** Ashby, D.E.T.F.; Hastie, R.J.; Hitchon, W.N.G.; Hughes, M.H. (UKAEA Culham Lab., Abingdon). 1982. 13p. Available from HMSO, London, price Pound 2.00.

The possibility of controlling the power output from INTOR and preventing 'thermal-runaway' by utilising the effect of magnetic field ripple on thermal transport has been investigated with a 1-D transport code; the code uses analytic expressions derived from current theories including the effects of localised particles. The results indicate that any significant control by ripple effects would appear impractical.

4150 **(CLM-R—231) Liquid lithium as a coolant for Tokamak fusion reactors.** Holroyd, R.J.; Mitchell, J.T.D. (UKAEA Culham Lab., Abingdon). 1982. 46p. Available from HMSO, London, price Pound 3.00.

Three-dimensional magnetohydrodynamic flows due to streamwise variations of duct dimensions and shape and magnetic field strength produce pressure gradients larger than those predicted by assuming local fully developed flow. These effects are included in this study of lithium cooling of the blanket of the Culham Conceptual Tokamak Reactor Mark IIA. Principal results are summarised in terms of the pumping power required to circulate the lithium coolant for specific wall loadings for various coolant piping designs and ranges of operating parameters.

4151 **(CLM-R—232) Predicted behaviour of the pumped limiter of INTOR.** Harrison, M.F.A.; Hotston, E.S. (UKAEA Culham Lab., Abingdon). Sep 1982. 24p. HMSO, London, price Pound 2.00.

Modelling of the pumped limiter envisaged for INTOR Phase IIA predicts that an effective exhaust of helium can be attained with a pumping speed of about 100 $m^3$ $s^{-1}$ provided that the power flow to the under-surfaces of a tungsten limiter plate is not less than about 6 MW; compatible with a tip loading of 1 MW $m^{-2}$. Plasma characteristics below the limiter plate are sensitive to the exhaust speed of the vacuum system. Tungsten and beryllium limiter plates are compared. The sputter rate of tungsten is low (typically $< 1$ cm/year); self-sputtering is not likely to be a problem even if the charged particle input power is as high as 40 MW. Sputter erosion of the beryllium plate is large (approximately 20 cm/year) and the helium exhaust pumping requirements for beryllium are about twice as demanding as those for tungsten. Localised recycling of DT ions in the immediate vicinity of the limiter is a significant transport mechanism when the scrape-off plasma density is approximately greater than $10^{19}$ $m^{-3}$. The charged particle power flow necessary to maintain this recycling is at least 4 MW and, there is a substantial temperature gradient between the sheath regions at the limiter plate and the bulk of the scrape-off plasma. The temperature at the separatrix distant from the plate may therefore be in excess of 50 eV.

4152 **(CONF-8210204—1) Performance characterization of pneumatic single pellet injection system.** Schuresko, D.D.; Milora, S.L.; Hogan, J.T.; Foster, C.A.; Combs, S.K. (Oak Ridge National Lab., TN (USA)). 1982. Contract W-7405-ENG-26. 19p. NTIS, PC A02/MF A01. Order Number DE84001954.

From American Vacuum Society meeting; Baltimore, MD, USA (16 Oct 1982).

The Oak Ridge National Laboratory single-shot pellet injector, which has been used in plasma fueling experiments on ISX and PDX, has been upgraded and extensively instrumented in order to study the gas dynamics of pneumatic pellet injection. An improved pellet transport line was developed which utilizes a 0.3-cm-diam by 100-cm-long guide tube. Pellet gun performance was characterized by measurements of breech and muzzle dynamic pressures and by pellet velocity and mass determinations. Velocities up to 1.4 km/s were achieved for intact hydrogen pellets using hydrogen propellant at 5-MPa breech pressure. These data have been compared with new pellet acceleration calculations which include the effects of propellant friction, heat transfer, time-dependent boundary conditions, and finite gun geometry. These results provide a basis for the extrapolation of present-day pneumatic injection system performance to velocities in excess of 2 km/s.

4153 **(DOE/ER/52061—1) Fusion reactors: physics and technology. Annual progress report.** Conn, R.W. (California Univ., Los Angeles (USA). Center for Plasma Physics and Fusion Engineering). Aug 1983. Contract AT03-80ER52061. 109p. NTIS, PC A06/MF A01. Order Number DE83017148.

Portions are illegible in microfiche products.

Fusion reactors are designed to operate at full power and generally at steady state. Yet experience shows the load variations, licensing constraints, and frequent sub-system failures often require a plant to operate at fractions of rated power. The aim of this study has been to assess the technology problems and design implications of startup and fractional power operation on fusion reactors. The focus of attention has been tandem mirror reactors (TMR) and we have concentrated on the plasma and blanket engineering for startup and fractional power operation. In this report, we first discuss overall problems of startup, shutdown and staged power operation and their influence on TMR design. We then present a detailed discussion of the plasma physics associated with TMR startup and various means of achieving staged power operation. We then turn to the issue of instrumentation and safety controls for fusion reactors. Finally we discuss the limits on transient power variations during startup and shutdown of $Li_{17}Pb_{83}$ cooled blankets.

4154 **(DOE/ER/53111—2) Alternate fusion-fuel-cycle plasma physics and reaction kinetics. Final report.** Conn, R.W. (California Univ., Los Angeles (USA)). 1981. Contract AT03-81ER53111. 3p. NTIS, PC A02/MF A01. Order Number DE83016802.

The bulk of the research is focused on the development and the application of the fusion reaction kinetic theory, and a continuing study of significant physics phenomena which impact current understanding of plasma reactivity, the energy balance, and the n tau requirement or predicted Q value of fusion fuel cycles.

4155 **(DOE/ET/52017—T1) Methods of economic analysis applied to fusion research. Final report.** (ECON, Inc., Princeton, NJ (USA)). 28 Feb 1983. Contract AC02-77ET52017. 105p. NTIS, PC A06/MF A01. Order Number DE84002366.

In this and previous efforts ECON has provided economic assessment of a fusion research program. This phase of study focused on two tasks, the first concerned with the economics of fusion in an economy that relies heavily upon synthetic fuels, and the second concerned with the overall economic effects of pursuing soft energy technologies instead of hard technologies. This report is organized in two parts, the first entitled An Economic Analysis of Coproduction of Fusion-Electric Energy and Other Products, and the second entitled Arguments Associated with the Choice of Potential Energy Futures.

4156 **(DOE/ET/53088—102) Sustained self-reversal in the reversed field pinch.** Aydemir, A.Y.; Barnes, D.C. (Texas Univ., Austin (USA). Inst. for Fusion Studies). Aug 1983. Contract FG05-80ET53088. 16p. NTIS, PC A02/MF A01. Order Number DE84001559.

Spontaneous reversal of the toroidal field in a Reversed Field Pinch as a result of low-$\beta$ kink-tearing mode activity is investigated using a 3D incompressible MHD code. Helical and 3D steady reversed states are obtained. In 3D a critical value of the

pinch parameter is observed above which only quasi-steady fluctuating states are seen.

4157 **(DOE/ET/53088—107) Elimination of stochasticity in stellarators.** Hanson, J.D.; Cary, J.R. (Texas Univ., Austin (USA). Inst. for Fusion Studies). Sep 1983. Contract FG05-80ET53088. 14p. NTIS, PC A02/MF A01. Order Number DE84001560.

A method for optimizing stellarator vacuum magnetic fields is introduced. Application of this method shows that the stochasticity of vacuum magnetic fields can be made negligible by proper choice of the coil configuration. This optimization is shown to increase the equilibrium $\beta$-limit by factors of two or more over that of the simple, straight coil winding law. This method is general and ought to be applicable to other systems in which stochasticity: (1) is a problem, yet (2) is affected by the design parameters.

4158 **(EGG-FT—6392) Final report on PE-II activities from August 1981-September 1983.** Deis, G.A.; Bohn, T.S.; Hsu, P.Y.; Liebenthal, J.L.; Longhurst, G.R.; Miller, L.G.; Schmunk, R.E.; Uldrich, E.D.; Wadkins, R.P.; Ware, A.G. (EG and G Idaho, Inc., Idaho Falls (USA)). Oct 1983. Contract AC07-76ID01570. 189p. NTIS, PC A09/MF A01. Order Number DE84002521.

This report documents all of the technical work performed by EG and G Idaho, Inc., from August 1981 through 1983 on Program Element-II (Blanket/Shield Thermal-Hydraulic/Thermomechanical Technology) of the Department of Energy (DOE) Office of Fusion Energy's First Wall/Blanket/Shield Engineering Technology Program. Following Section 1 which is a summary of the overall program, six major activities are described in separate sections. Section 2 is an evaluation of methods for simulation fusion bulk heating for thermal-hydraulic/thermomechanical testing. Section 3 is a survey of facilities which might be suitable for such testing. Section 4 describes the development of a strategy for resolving the identified thermal-hydraulic/thermomechanical data needs through a combination of nuclear and nonnuclear testing. Section 5 is a detailed plan for work in Phase I of Program Element-II. Sections 6 and 7 describe two activities undertaken by EG and G: the design of the nonnuclear solid-breeder concept integral simulation test, and the planning for a nuclear test which could follow it. Following these activities, EG and G participation in Program Element-II was terminated; thus, this report serves as the final report on technical work for Program Element-II at Eg and G.

4159 **(GAO/RCED—83-105) Status of DOE's implementation of the Magnetic Fusion Energy Engineering Act of 1980.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 29 Apr 1983. 37p. General Accounting Office, Document Handling and Information Service Facility, P.O. Box 6015, Gaithersburg, MD 20760.

The Magnetic Fusion Energy Engineering Act of 1980 authorized an accelerated and ambitious research and development program directed toward the commercial demonstration of nuclear fusion - a potentially inexhaustible source of energy - by the end of the century. Although progress has been made, funding for the program has not been sustained at the levels envisioned in the act. Consequently, DOE has adjusted its fusion research program and revised its fusion development strategy to fit available and projected funding levels. GAO believes that DOE needs to explain and justify its revised fusion development strategy to the Congress. The appropriate place is the act's required comprehensive program management plan to be submitted to relevant congressional committees. According to DOE, budget uncertainties initially delayed preparation of the plan and its final issuance is now being held up by extensive reviews both internally and by the Executive Office of the President.

4160 **(HEDL-SA—2987) FMIT: an accelerator-based neutron factory for fusion materials qualification.** Burke, R.J.; Hagan, J.W.; Trego, A.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 1983. Contract AC06-76FF02170. 7p. (CONF-830920—10). NTIS, PC A02/MF A01. Order Number DE84001464.

From 7. symposium on sources and ion assisted technology and 4. international conference on ion and plasma assisted techniques; Kyoto, Japan (12 Sep 1983).

The Fusion Materials Irradiation Test Facility will provide a unique testing environment for irradiation of structural and special-purpose materials in support of fusion-power systems. The neutron source will be produced by a deuteron-lithium stripping reaction to generate high-energy neutrons to ensure materials damage characteristic of the deuterium-tritium power system. The facility, its testing role, the status, and major aspects of its design and supporting system development are described. Emphasis is given to programmatic elements and features incorporated in the accelerator and other systems to assure that the FMIT runs as a highly reliable fusion materials testing installation.

4161 **(IA—1378) Laser-driven shock wave studies in single and double-layered slab targets.** Eliezer, S.; Gitter, L.; Krumbein, A.D.; Salzmann, D. (Israel Atomic Energy Commission, Yavne. Soreq Nuclear Research Center). Jan 1983. 46p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700017.

Simulations of laser-driven shock waves were carried out by means of a 1-D Lagrangian hydrodynamic code for polyethylene and aluminium slab targets. It was found that the shock front is accelerated into the cold material till t is approximately 0.8 tau (tau is the laser pulse width) and only later is a constant velocity propagation attained. Scaling laws were obtained for the pressure and temperature of the compression wave, which are in good agreement with those published in other works. Calculations of pressure, compression and shock wave motion were also carried out for laser-driven slab targets composed of $CH_2$ on aluminium and aluminium on $CH_2$ in the intensity range of $10^{13}$ to $10^{14}$ W/cm$^2$. High compressions were found to occur at the interface of $CH_2$ on Al targets due to impedance mismatch but were not found when the layers were reversed. The persistence time of the high pressure on the interface in the $CH_2$ on A1 case is long relative to the characteristic times of the plasma. It was also found that the pressure and compression on the interface can be optimized by adjusting the $CH_2$ layer thickness.

4162 **(IAE—3525/8) Calculation of temperature fields in the pulsed fusion reactor blanket elements.** Lipov, M.Yu.; Murav'ev, E.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1982. 25p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703991.

The formation of temperature fields in pulsed fusion reactor blanket elements is considered. The problem is set on a temperature field in an unlimited flat wall at instantaneous volumetric heating and boundary conditions of a third kind with the constant physical properties of the wall and coolant materials. An analytical solution of the problem is given. The basic regularities in the temperature field formation in a flat wall are shown, in particular the existence of a steady temperature field whose characteristics have been determined by two ways. The time is determined of the steady operation attainment, and calculation is performed of the temperature and temperature drop in the wall material at the initial period of the facility operation. The steady temperature field has been studied in detail. The results are presented in the form of dimensionless relationships for a wide range of operating parameters. The model elaborated may be used for the estimation calculations when selecting the balnket parameters or other assemblies of pulsed fusion reactor design members and conditions for their cooling.

4163 **(IAE—3545/7) Evolution of spontaneous magnetic fields in an expanding laser-produced plasma.** Bol'shov, L.A.; Dykhne, A.M.; Kiselev, V.P.; Favorskij, A.P.; Yudin, A.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1982. 26p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE84700018.

The generation process of spontaneous magnetic fields in an expanding laser-produced plasma is studied. It is shown that the initial stage of magnetic fields evolution in plasma heated with laser radiation is correctly reflected in the magnetic-thermal statement of

the problem. The saturation of the magnetic field generation has a threshold with respect to the sharpness of the heat contribution spatial distribution. The allowance for the plasma movement restricts the maximum of the magnetic field; its effect on the integral characteristics, such as the total flow through the calculated region, is considerably smaller. The main cause of the stabilization of the magnetic field magnitude is the correlation of electron density and temperature profiles. The magnetic fields generation affects significantly the heat transfer processes, and leads to electron overheat. A contrary effect of the magnetic field on the generation process, leading to the increase in the magnetic field flow, takes place. The allowance for the ionization processes during laser heating shows that the main characteristics of magnetic fields in this case slightly differ from the stripped plasma case.

4164 (IAEA-TECDOC—277, pp 11-13) **Past IAEA activities in the area of fusion safety. A brief overview.** Flakus, F.N. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Safety). Mar 1983. NTIS (US Sales Only), PC A09/MF A01. (CONF-810352—).

From International Atomic Energy Agency conference on fusion safety; Vienna, Austria (23 Mar 1981).

Published in summary form only.

4165 (IAEA-TECDOC—277, pp 15-44) **Tritium handling requirements and development for fusion.** Anderson, J.L. (Los Alamos National Lab., NM (USA)). Mar 1983. NTIS (US Sales Only), PC A09/MF A01. (CONF-810352—).

From International Atomic Energy Agency conference on fusion safety; Vienna, Austria (23 Mar 1981).

Tritium technology development for the Department of Energy fusion program is taking place principally at three laboratories; Mound Facility, Argonne National Laboratory, and Los Alamos National Laboratory. This paper reviews major aspects of these three programs and discusses aspects of the tritium technology development at other laboratories in the U.S. Facilities and experiments discussed include the Tritium Effluent Control Laboratory and the Tritium Storage and Delivery System for the Tokamak Fusion Test Reactor at Mound Facility, the Lithium Processing Test Loop and the solid breeder blanket studies at Argonne, and the Tritium Systems Test Assembly at Los Alamos. Work at the Lawrence Livermore National Laboratory and the Oak Ridge National Laboratory will also be discussed.

4166 (IAEA-TECDOC—277, pp 49-62) **Summary of HEDL Fusion Reactor Safety Support studies.** Muhlestein, L.D.; Jeppson, D.W.; Barreca, J.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1983. NTIS (US Sales Only), PC A09/MF A01. (CONF-810352—).

From International Atomic Energy Agency conference on fusion safety; Vienna, Austria (23 Mar 1981).

The HEDL Fusion Reactor Safety Support studies are focused on characterizing blanket-coolant-material reactions for deuterium-tritium fusion reactor designs. The objective is to determine and examine potential safety and environmental issues associated with proposed blanket/coolant combinations under postulated accident conditions. The first studies considered liquid lithium as both blanket and coolant, and examined liquid lithium-material reactions. Liquid lithium reactions with oxygen, nitrogen, and various concretes have been characterized. Evaluations of lithium reaction extinguishment methods, lithium aerosol generation and collection, and the volatilization and transport of radioactive materials in connection with lithium-air reactions have been completed. Lithium compound blanket material reactions with water, a prime coolant candidate, have been characterized in terms of energy and gas release rates. Blanket materials considered were lithium aluminate, lithium oxide, lithium zirconate, lithium silicate, and lithium lead alloys ($Li_7Pb_2$ and $Li_{17}Pb_{83}$).

4167 (IAEA-TECDOC—277, pp 65-77) **Safety methodology and risk targets.** Kazimi, M.S. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Mar 1983. NTIS (US Sales Only), PC A09/MF A01. (CONF-810352—).

From International Atomic Energy Agency conference on fusion safety; Vienna, Austria (23 Mar 1981).

In assessing the potential safety concerns of fusion, the experience from other energy sources lead to a variety of safety assessment approaches. The available approaches are: (1) The maximum possible accident approach; (2) The maximum credible accident approach; (3) The probabilistic total risk assessment. In the first approach, the mechanistic development of the events leading to the safety concern is ignored. Instead, the total radioactivity of the plant is assumed accessible to the public. Such an approach is obviously conservative and unrealistic. In the second approach a selection is made among the most severe of the possible accidents, and the progression of the accident is modeled as mechanistically as possible. In this case, the passive and active accident mitigation capabilities of the plant are taken into consideration. The result is expected to be that none or only a fraction of the total radioactivity can be released to the public. The adverse effect of this approach is to concentrate attention on a particular accident class, and perhaps not allow for other classes, a judgement that may later become undesirable. The probabilistic risk assessment requires the safety analysts to consider all classes of accidents and estimate both the probabilities of their occurrences and their consequences. Thus, the plant design in fact is subjected to a thorough investigation and the impact of alterations in design can be reflected in the total risk estimate. The disadvantage of this approach lies in the absence of well defined acceptable risk criteria as well as the large effect of public perception factors on the accepted risk. This paper will review the impact of application of these approaches in determination of the level of protection needed against activation product release to the atmosphere.

4168 (IAEA-TECDOC—277, pp 93-105) **Superconducting magnet safety.** Arendt, F.; Komarek, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Technische Physik). Mar 1983. NTIS (US Sales Only), PC A09/MF A01. (CONF-810352—).

From International Atomic Energy Agency conference on fusion safety; Vienna, Austria (23 Mar 1981).

One of the major components in a fusion reactor for which a safety analysis must be carried out is the magnet system. Most of the possible disturbances influencing the operation of superconducting magnets lead only to a quench, defined as an "abnormal operating condition" which causes just a temporary shut down of the magnet system without damage, if the system is well designed. More unlikely are accidental events which are associated with the generation of high power arcs. In these cases, single current arcs, e.g. at broken current leads, will lead to moderate damage only, but with the necessity of a longer shut down period for repair or replacing. Severe damage can only occur if in a multiple current arcing, starting by broken conductors, a wide-spread rupture of the winding occurs and the final high power arc burns through the coil case damaging other coils and reactor components. In a very hypothetical event the simultaneous rupture of the complete winding at two locations at least 1 m apart leads to missile generation due to the electromagnetic forces in the background field. The kinetic energy which the flying piece can get will be less than the values assumed for airplane crashes with the containment of modern fission power plants.

4169 (IAEA-TECDOC—277, pp 155-159) **Fusion safety and protection issues: Lessons from fast breeder reactors and reprocessing plant studies.** Rouyer, J.L. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). Mar 1983. NTIS (US Sales Only), PC A09/MF A01. (CONF-810352—).

From International Atomic Energy Agency conference on fusion safety; Vienna, Austria (23 Mar 1981).

The experience gained in the design and operation of nuclear reactors and fuel cycle facilities should be used to: develop a safety analysis which helps the designers and provides workers and public protection; provide means to respond to tritium problems; study the non-radioactive risks. This effort should give a high priority to technical evolution and innovations.

4170 **(IPPJ—553) Bremsstrahlung energy loss of degenerate plasma.** Yamaguchi, Seiya; Kawata, Shigeo; Abe, Takashi; Niu, Keishiro. (Nagoya Univ. (Japan). Inst. of Plasma Physics). Mar 1982. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700022.

The integrated emission coefficient for bremsstrahlung is derived for the plasma with an arbitrary electron degeneracy. This coefficient is shown to have two plausible limiting values of classical and fully degenerate cases. It is pointed out that the effect of electron degeneracy reduces the bremsstrahlung energy loss to $10^{-2}$ times of that in the nondegenerate case in the typical state of an ICF target whose number density is $4.5 \times 10^{26}/cm^3$ and temperature is $10^6$K.

4171 (JAERI-M—9775, pp 19-24) **Trapping and re-emission of energetic hydrogen and helium ions in materials.** Yamaguchi, Sadae (Tohoku Univ., Sendai (Japan). Faculty of Engineering). Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

The experimental results on the trapping and re-emission of energetic hydrogen and helium ions in materials are explained. The trapping of deuterium and helium in graphite saturates at the concentration of $10^{18}$ ions/cm$^2$. The trapping rate of hydrogen depends on the kinds of target materials. In the case of the implantation in Mo over $3 \times 10^{16}$ H/cm$^2$, hydrogen is hardly trapped. On the other hand, the trapping of hydrogen in Ti, Zr and Ta which form solid solution is easily made. The hydrogen in these metals can diffuse toward the inside of metals. The deuterium retained in 316 SS decreased with time. The trapping rate reached saturation more rapidly at higher implantation temperature. The effective diffusion constant for the explanation of the re-emission process is 1/100 as small as the ordinary value. The radiation damage due to helium irradiation affects on the trapping of deuterium in Mo. The temperature dependence of the trapping rate can be explained by the diffusion model based on the Sievert's law. The re-emission of helium was measured at various temperature. At low temperature, the re-emission was low at first, then the rate increased. At high temperature, the re-emission rate was high from the beginning.

4172 (JAERI-M—9775, pp 25-31) **Trapping-detrapping phenomena of hydrogen, helium and their isotopes into or from materials.** Kudo, Hiroshi (Tsukuba Univ., Sakura, Ibaraki (Japan)). Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

The experimental results on the trapping-detrapping phenomena of hydrogen, helium and their isotopes are reviewed. The depth distribution and the amount of trapping of H or He implanted into solids have been measured by ion backscattering and nuclear reaction methods. The measurements showed the blistering included in the trapping phenomena. The depth distribution of deuterium implanted into Zr showed a peak near the surface at 250 degree K. This peak may be the trapping by the field of stress due to the radiation damage of Zr or implanted deuterium. The trapping occurred in the form of precipitation in hydride-forming materials such as Zr. The trapping of deuterium in Zr was found at the position of radiation damage. The trapping of deuterium in the complex of Y and a hole made in iron was reported.

4173 (JAERI-M—9775, pp 32-46) **Reflection of low-energy light-element ions from solid surfaces.** Gesi, Kazuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Nov 1981. NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

Brief description of the reflection process of low-energy light-element ions from solid surfaces is presented in this paper. The definitions of parameters which describe the process are given. The species and energy of incident particles, the direction of incidence, the species, surface state, temperature and pre-treatment of targets, and the index of the surface plane are the important parameters to describe the phenomena. The informations about reflected particles were obtained through the scattering function. Energy distribution, spatial distribution, the fraction of the charged states, total particle reflectivity, mean reflected energy, and total energy reflectivity are the items of discussion. The total particle reflectivity as a function of reduced incident energy has been given for various combination of incident particle species and target materials. A universal relation was seen between the reflectivity and the reduced energy, and it can be represented by an empirical formula. A peak was observed in the energy distribution profiles of the reflected helium atoms from Ni surface. This peak, called surface peak, was caused by a single elastic collision of incident particles against surface atoms. The fractional intensity of the various charged states of reflected particles was measured when Au was bombarded with $H_2$ ions. The spatial distribution of the particle reflection has been measured. The computer simulation was also made, and good agreement with the observed results was seen.

4174 (JAERI-M—9775, pp 47-52) **Empirical formulas for the reflection of light ions from solids.** Tabata, Tatsuo (Radiation Center of Osaka Prefecture, Sakai (Japan)). Nov 1981. NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

A study on the formulation of an empirical equation related to the reflection of light ions from solids is described. The parameters considered were the number reflection coefficient, the energy reflection coefficient and the relative mean energy. The targets were classified into two groups, since there is deviation from the scaling law. The materials with the stopping power near the minima of $Z_2$-oscillation have been classified into group 1, and those with the stopping power near the maxima into group 2. The constants in the proposed empirical formula were determined through the least-squares fit to the available experimental data, and the representative sets of Monte Carlo data at lower energy. The formula was compared with the data points and satisfactory agreement was seen.

4175 (JAERI-M—9775, pp 53-58) **Reflection of low energy light-element ions from solid surfaces.** Morita, Kenji (Nagoya Univ. (Japan). Faculty of Engineering). Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

The reflection of low energy light-element ions from solid surfaces has been studied. The parameters to be considered are particle reflectivity and energy reflectivity. These are important for the estimation of the reflection of light ions from the first walls of fusion reactors. The formulas for these parameters as the functions of reduced energy have been presented. Since the reflected particles in the considered energy range are mostly neutral particles, the experimental apparatuses for the observation are large scale devices, and the measurement is time-consuming and troublesome. The development of various experimental methods has been done. The experimental results showed that the particle reflectivity decreased monotonously with the increase of reduced energy, and the energy reflectivity showed the same pattern. The transport theory, the single collision model and the computer simulation were applied for the explanation of the phenomena.

4176 (JAERI-M—9775, pp 59-71) **Desorption by ions and electrons.** Nagai, Shiro (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

Review of the studies on ion-impacted desorption (IID) and electron-stimulated desorption (ESD) is presented. The mechanism of ESD can be explained by a same model proposed by Menzel and Gomer as well as Redhead. The model is based on the one-dimensional classical theory, and is similar to an excitation model for gas phase molecules. Most of the experimental results are explained by the model except the desorption of oxygen atoms from metal surfaces. The desorbing species are mostly the neutral molecules at the

ground states. The energy distribution of desorbing ions has been measured. The desorption cross sections (Q) were measured. The Q for neutral molecules is about $10^{-18}$ cm², and that for positive ions is $10^{-22}$ cm², when the impact energy of electrons is about 100 eV. The data of IID are scarce. Since the cross sections reported are larger than those of ESD, the IID may be important for the study on the plasma-wall interaction. The IID can be explained by a two-body collision model based on the sputtering model by Sigmund. The IID cross sections are inversely proportional to the adsorption heat. The cross sections reported are in the range from $10^{-14}$ to $10^{-17}$ cm².

4177 (JAERI-M—9775, pp 89-94) **Stopping power and effective charge of low-velocity ions in metals.** Kitagawa, Mitsuo (North Shore College, Atsugi, Kanagawa (Japan)); Brandt, W. Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

The stopping power and effective charge of low-velocity ions in metals were analyzed. The electron excitation part in the energy loss process of charged particles passing through materials can be divided into close collision and distant collision. The minimum collision coefficient of the close collision (individual collision) is smaller than the ion radius, and the effective charge is larger than the amount of charge of ions. This effect increases with the small atomic number of ions and in the low energy region. The stopping power was defined and calculated, and the effective charge ratio was also obtained. The deviation of the effective charge from a universal curve is explained. The velocity dependence of ion charge was analyzed. A curve obtained from a numerical analysis by the Brandt's velocity condition shows a good agreement with the experimental results.

4178 (JAERI-M—9775, pp 95-99) **Identification and lattice location of low-Z impurities implanted into solids.** Komaki, Ken-ichiro (Tokyo Univ. (Japan). Coll. of General Education). Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

The methods of the identification and lattice location of low-Z impurities implanted into solids are described. The detection of impurities which have larger mass number than that of matrix materials is made by the Rutherford back-scattering (RBS) of heavy ions. The detection of light elements can be made by nuclear reaction methods. The depth distribution of impurities is obtained from the measurement of the energy loss of incident and emitted particles. The channeling effect of incident particles and the blocking effect of emitted particles are used for the determination of the lattice location of impurites. The behavior of hydrogen isotopes is an important problem for the first wall technology of fusion reactors, but the reports on this problem are hardly seen at present.

4179 (JAERI-M—9775, pp 101-117) **Ion irradiation damage of metals.** Kiritani, Michio; Sasaki, Shigemi (Osaka Univ., Toyonaka (Japan). Faculty of Engineering Science). Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

A study on the ion irradiation damage of metals and a review of the studies on the cross-sections of ion irradiation damage are described. The experimental study has been performed with Van de Graaff type accelerators of Japan Atomic Energy Research Institute (JAERI). The irradiated samples were observed with an electron microscope. High temperature argon ions were irradiated on high purity Ni, and the structure of damage was observed. The light ion irradiations on Ni and Mo were also performed. The void formation in Ni irradiated by Ar was due to Ar atoms. It was found that large voids near the surface contracted to medium size voids, but voids at deep positions were hard to contract. The depth distribution of defects in Ni and Mo irradiated with light ions at room temperature deviated largely from the estimation of the projected range of ions. The investigation of the studies on the cross-sections of ion irradiation damage was made and is reported. The problems studied at various laboratories were the irradiation by self-ions, the segregation under irradiation, the depth distribution of damage and helium implantation effects.

4180 (JAERI-M—9775, pp 118-124) **Defect production rates in ion-irradiated metals.** Iwata, Tadao (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

The defect production rate in metals irradiated with fast ions at low temperature was investigated. The detection of defects was made by measuring electric resistivity. The average number of primary knock-on atoms (PKA) is obtained as a function of displacement threshold energy. At the Argonne National Laboratory, the defect production rate in Cu and Ag was obtained from the measurement of electric resistivity. The damage efficiency, which is the ratio of the experimental values and the theoretical values of damage cross-sections, was obtained. The damage efficiency decreased from 1 to 0.3 when the energy of the PKA increased. At ORNL, the depth distribution of defects was measured. The self-ion implantation to Al and Ni and the Ni-ion irradiation on Fe-Cr alloy were made, and the distribution of defects was obtained. The results were compared with the theoretical results. The experiments on other metals are also described.

4181 (JAERI-M—9775, pp 125-129) **Blistering due to neutral He particle bombardment in refractory metals.** Nunogaki, Masanobu; Okada, Touichi (Osaka Univ., Suita (Japan). Faculty of Engineering). Nov 1981. (In Japanese). NTIS (US Sales Only), PC A08/MF A01. (CONF-810189—).

From Workshop on the particle material interaction for fusion research; Tokyo, Japan (12 Jan 1981).

A method to obtain neutral particle beam which has widely distributed energy spectra is developed. Neutral He beam was produced by this method, and a Mo plate was irradiated at 300 degree K. The blistering was formed and observed. It was found that the blistering was formed by the neutral beam with continuously changing energy, the area distribution of blister surfaces spread widely, and the various shapes of blistering were observed. These results were due to the effect of beam energy dispersion. The reports on blistering published mainly in 1980 are introduced in this paper.

4182 (KAERI/RR—381/82) **Survey of fusion reactor technology. Development of design technology for the magnet system of Tokamak fusion reactor.** Chung, M.K.; Kang, H.D.; Oh, Y.K.; Lee, K.W.; In, S.Y.; Kim, Y.C. (Korea Advanced Energy Research Inst., Seoul (Republic of Korea)). 1983. 116p. (In Korean). NTIS (US Sales Only), PC A06/MF A01. Order Number DE84700034.

The present object of the fusion research is to accomplish the scientific break even by the year of 1986. In view of current progress in the field of Fusion reactor development, we decided to carry out the conceptual design of Tokamak-type fusion reactor during the year of 82-86 in order to acquire the principles of the fusion devices, find the engineering problems and establish the basic capabilities to develop the key techniques with originality. In this year the methods for calculating the locations of the poloidal coils and distribution of the magnetic field, which is one of the most essential and complicated task in the fusion reactor design works, were established. Study on the optimization of the design method of toroidal field coil was also done. Through this work, we established the logic for the design of the toroidal field coil in tokamak and utilize this technique to the design of small compact tokamak. Apart from the development work as to the design technology of tokamak, accelerating column and high voltage power supply (200 KVDC, 100 mA) for intense D-T neutron generator were constructed and now beam transport systems are under construction. This device will be used to develop the materials and the components for the tokamak fusion reactor.

4183 (KEK—79-17, pp 155-168) **Enhancement of energy deposition of intense electron beam on low Z targets.** Nakai, S.; Imasaki, K.; Miyamoto, S.; Higaki, S.; Nishihara, K. (Osaka Univ. (Japan)). Aug 1979. NTIS (US Sales Only), PC A06/MF A01. (CONF-7903159—).

From 2. KEK symposium on radiation dosimetry; Oho, Ibaraki, Japan (22 Mar 1979).

The interaction between intense electron beam and solid target has been investigated. A strongly enhanced deposition of tightly focused REB on low Z solid target is experimentally observed. The results are explained by the dissipation model due to kinetic two stream instability in corona plasma.

4184 (LA—9737-MS) **Modular stellarator reactor: a fusion power plant.** Miller, R.L.; Bathke, C.G.; Krakowski, R.A.; Heck, F.M.; Green, L.; Karbowski, J.S.; Murphy, J.H.; Tupper, R.B.; DeLuca, R.A.; Moazed, A. (Los Alamos National Lab., NM (USA)). Jul 1983. Contract W-7405-ENG-36. 323p. NTIS, PC A14/MF A01. Order Number DE84002268.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

A comparative analysis of the modular stellarator and the torsatron concepts is made based upon a steady-state ignited, DT-fueled, reactor embodiment of each concept for use as a central electric-power station. Parametric tradeoff calculations lead to the selection of four design points for an ~ 4-GWt plant based upon Alcator transport scaling in l = 2 systems of moderate aspect ratio. The four design points represent high-aspect ratio. The four design points represent high-(0.08) and low-(0.04) beta versions of the modular stellarator and torsatron concepts. The physics basis of each design point is described together with supporting engineering and economic analyses. The primary intent of this study is the elucidation of key physics and engineering tradeoffs, constraints, and uncertainties with respect to the ultimate power reactor embodiment.

4185 (NIIEFA-P-B—0558) **Normal phase detection in the "Tokamak-15" toroidal coil.** Dubasov, V.G.; Zhelamskij, M.V. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1982. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700036.

Requirements for a normal phase (NP) detection device used to protect the toroidal field superconducting coil (TFSC) in the "Tokamak-15" are given. Principles of device construction are described, block diagrams are presented. The device is based on the detection of active voltage that appears at the TFSC when its sections transit to the normal state. The coil protection device has two functions: 1) high-sensitive detection of a transition for the current control in order to recover superconductivity by changing the TFSC current; 2) protective energy removal from the TFSC when the current change does not cause disappearance of the normal phase and it achieves the permitted level (protective level). The device detects NP-signal in the protective output regime at the level of 100-500 mV, in current control regime at 2-50 mV under the noise level +-0.5 V. The detection time may be chosen in the range of 0.01-0.5 s depending on the noise duration. Insulation of the galvanic decoupling units takes the voltage of 3 kV. High reliability of the system is ensured by reserve channel and emergency protection channel that control the state of the basic units.

4186 (NIIEFA-P-B—0573) **Numerical simulation of the operation regimes of the poloidal field system of a tokamak reactor.** Filatov, O.G. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1982. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703996.

Numerical simulation of the operation regimes of the poloidal field system of a tokamak reactor without magnetic core at designed discharge evolution is considered. The technique of the problem solution realized in POLO computerized program is described. As an example, results of numerical calculation of operation of the INTOR tokamak reactor with poloidal limiters and without a divertor are presented.

4187 (NIIEFA-P-G—0555) **Study on the poloidal magnetic fields in the "Tuman-3" device.** Belyakov, V.A.; Vasil'ev, V.I.; Kolchin, A.G. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1982. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703997.

Portions are illegible in microfiche products ref.; 18 figs.

Results of the study on the poloidal magnetic fields using the "Tuman-3" device are presented. The magnetic circuit core located near plasma area (the aspect relation of the device R/a is 2.3) considerably affects the conditions maintaining plasma filament equilibrium. The data from the experimental study are compared to the calculated data obtained when solving the magnetostatic problem in axial symmetry approximation. The calculated data are in agreement with the experimental ones to an accuracy of approximately 5% for the given model of the magnetic circuit. With the coil configuration of the poloidal field chosen the stability of plasma filament equilibrium on a large raduis is maintained, the instability along the vertical being weak. The shape of plasma filament section is close to circular. The poloidal magnetic field characteristics in the chosen mode of operation of the device weakly depend on the magnet core saturation coefficient. In developing the control system of plasma filament position the results of measurements have been used.

4188 (NIIEFA-P-OM—0542) **Calculation of the mechanical strength of the T-15 tokamak discharge chamber.** Gusev, S.V.; Odintsov, V.N.; Rogov, E.A.; Samojlenko, V.D.; Semenov, O.V.; Spirchenko, Yu.V.; Chvartatskij, R.V. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1981. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE84700038.

Results of investigation of stress-strained state of the T-15 tokamak discharge chamber under the effect of atmosphere pressure, temperature and magnetic forces are presented. Results of experiments on serviceability of bellows of vertical and horizontal pipes are given. Low cycle fatigue strength of chamber elements is defined. When evaluating the chamber element service life in the vacuum training regime (at atmospheric pressure and temperature of 400 deg C), the least allowed number of repeated loading $N=4x10^3$ is obtained, that essentially exceeds practically realizable number of emergency loadings. Evaluation of chamber aeroice life in operational regime (under the effect of magnetic forces) showed that allowed load cycle number is $N=1.2x10^5$.

4189 (NIIEFA-P-OM—0550) **To the calculation of stress-strained state of the discharge chambers of tokamak devices.** Zhilin, P.A.; Konyushevskaya, R.I.; Pal'mov, V.A.; Chvartatskij, R.V. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1982. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703998.

A numerical computation algorithm of stress-strained state of rotational shells at axially symmetric loads is presented. A boundary problem is brought to a number of Cauchy problems. When constructing initial problems the Runge-Kutta method is used alongside with the Godunov method of descrete orthogonalization. Concrete calculation is carried out for the discharge chamber of thermonuclear device that has cylindrical, conical and toroidal parts. Comparative evaluation of stress-strained state of smooth and meridional ribbed chambers is carried out.

4190 (NRL-MR—5161) **Observation of magnetic fields in laser-produced plasma using the Zeeman effect.** McLean, E.A.; Stamper, J.A.; Manka, C.K.; Griem, H.R.; Droemer, D.W.; Ripin, B.H. (Naval Research Lab., Washington, DC (USA)). 30 Sep 1983. Contract AI08-79DP40092. 30p. NTIS, PC A03/MF A01. Order Number DE84002742.

The self-generated magnetic field produced when a pulsed Nd:glass laser is focused onto a carbon foil target is measured for the first time using the Zeeman effect. Emission from the CV $1s2s^3S/sub\ 1^-/\ 1s2p^3P_2$ (2270.9A) was used for the measurement. At a laser irradiance of ~ 5 x $10^{13}$ W/cm$^2$, the magnetic field increased from 100 kG to 200 kG when the focal spot was changed

from a flat-topped distribution to a ring pattern, which caused higher density gradients. A Faraday rotation measurement at ~ 200 kG agreed with the Zeeman effect measurement. Opacity effects in the plasma enhanced the sensitivity of the Zeeman measurement.

4191 **(NRL-MR—5186) Variation of laser absorption with plasma scalelength in long-scalelength plasmas.** Herbst, M.J.; Grun, J.; Gardner, J.; Stamper, J.A.; Young, F.C.; Obenschain, S.P.; McLean, E.A.; Ripin, B.H. (Naval Research Lab., Washington, DC (USA)). 30 Sep 1983. Contract AI08-79DP40092. 12p. NTIS, PC A02/MF A01. Order Number DE84002743.

A short-pulse, high-intensity Nd-laser beam interacts with performed plasmas of variable scalelength. At the longest scalelength, absorption is limited by backscatter, despite increased collisional absorption.

4192 **(ORNL/TM—8826) Modification for correcting a vacuum design fault in the Veeco Model MS 170 Leak Detector.** Langley, R.A. (Oak Ridge National Lab., TN (USA)). Oct 1983. Contract W-7405-ENG-26. 7p. NTIS, PC A02/MF A01. Order Number DE84002249.

A vacuum design fault in the Veeco Model MS 170 Leak Detector is described and a simple and inexpensive solution to correct the fault is provided.

4193 **(TRITA-PFU—80-10) External magnetic field configurations for EXTRAP.** Bonnevier, B. (Royal Inst. of Tech., Stockholm (Sweden). Plasma Physics and Fusion Research). Aug 1982. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704001.

The strongly inhomogeneous magnetic field for stabilization of a pinch in an Extrap configuration can be created in various ways. Some possibilities both for the linear case and for the toroidal case are discussed.

4194 **(UCID—19903) Granular flow considerations in the design of a cascade solid breeder reaction chamber.** Walton, O.R. (Lawrence Livermore National Lab., CA (USA)). Oct 1983. Contract W-7405-ENG-48. 36p. NTIS, PC A03/MF A01. Order Number DE84002474.

Both horizontally and vertically oriented rotating chambers with granular material held on the inner surface by centrifugal action are examined. Modifications to the condition for controlled quasi-static flow on an incline plane, phi/sub w/ $< \alpha <$ phi/sub r/, where phi/sub w/ is the wall friction angle, $\alpha$ is the angle of inclination of the plane, and phi/sub r/ is the drained angle of repose of the material are examined for the case of horizontal and vertical surfaces of revolution. Allowed included half angles for horizontally oriented chambers are likely to be in the range of $30^{\circ} +- 10^{\circ}$ for ceramic particles and metal surfaces. For vertical orientations the maximum half-angle of the top cone is slightly less than the wall friction angle phi/sub w/ while the lower portion can have a half angle as large as ($90^{\circ}$ - phi/sub w). Percolation of fines through shearing granular solids is briefly discussed and recommended experimental and calculational studies to obtain a better understanding of this behavior are described.

4195 **(UCRL—88669) Design and construction of large capacitor banks.** Whitham, K.; Gritton, D.G.; Holloway, R.W.; Merritt, B.T. (Lawrence Livermore National Lab., CA (USA)). 1983. Contract W-7405-ENG-48. 9p. (CONF-830621—47). NTIS, PC A02/MF A01. Order Number DE84002790.

From IEEE power electronics specialists conference; Albuquerque, NM, USA (6 Jun 1983).

Portions are illegible in microfiche products.

Over the past 12 years, the Laser Program at LLNL has actively pursued laser fusion, using a series of large, solid-state lasers to develop target data leading to reactor designs using the concept of inertial confinement fusion. These lasers are all linear chains of flashlamp driven, Nd-doped glass amplifiers with a master oscillator at the front end. Techniques have been developed during this time to scale the lasers to an arbitrarily large size. A table shows the series of lasers and their parameters that have been developed to date.

4196 **(UCRL—88690) Optimized rotary flux compressors for powering laser flashlamps.** Carder, B.; Lundberg, R. (Lawrence Livermore National Lab., CA (USA)). 1983. Contract W-7405-ENG-48. 5p. (CONF-830621—46). NTIS, PC A02/MF A01. Order Number DE84002794.

From IEEE power electronics specialists conference; Albuquerque, NM, USA (6 Jun 1983).

Two ARFC's were optimized with the LLNL code. The large machine had a 42-inch diameter rotor. It provided 14 MJ of energy to a flashlamp load in a 900 $\mu$sec, 16 GW pulse. Its mass was 30 tonnes. The small machine provided a peak power of 8 GW in a 590 $\mu$sec pulse, and delivered 5.4 MJ to the flashlamp load. Its mass was 13 tonnes. The parameters of these optimized machines are summarized in Table 1. Both of these devices were 8 pole ARFC's with two turns per pole.

4197 **(UCRL—89195) Issues in radioactivity for fusion energy: remote maintenance rating.** Dorn, D.W.; Maninger, R.C. (Lawrence Livermore National Lab., CA (USA)). 14 Sep 1983. Contract W-7405-ENG-48. 26p. (CONF-831203—1). NTIS, PC A03/MF A01. Order Number DE83018180.

From 10. symposium on fusion engineering; Philadelphia, PA, USA (5 Dec 1983).

Recent technical progress in fusion research has been sufficient to encourage the development of conceptual designs for fusion power systems. These design efforts suggest that more attention should be paid to the safety and environmental effects of the radioactivity induced in the structural materials by the fusion neutrons. In particular, radioactivity from neutron activation of the structural components of a fusion power system will be a concern for occupational exposure of personnel. Careful choice of structural materials can significantly reduce this exposure. We propose the Remote Maintenance Rating (RMR) as a numerical means of comparing materials and machine designs with respect to occupational exposures. The RMR is defined as the dose rate at the surface of a uniformly activated, thick, infinite slab with the same composition and density as the machine component. We used the RMR rating system to evaluate the suitability of several different iron-based alloys. The specific fusion power system design used in our evaluation was a conceptual design from the Mirror Advanced Reactor Study (MARS). We determined that HT-9 is significantly better in terms of radiological dose rates at early times than the other iron-based alloys (by a factor of 3 to 7). We also calculated the behavior of both silicon carbide (SiC) and aluminum (Al), two low activation materials often proposed for reactors.

4198 **(UCRL—89327) Control of gas input and background pressure in the end plug regions of the TMX-U thermal barrier experiment.** Turner, W.C.; Nexsen, W.E.; Allen, S.L.; Hooper, E.B.; Hunt, A.L.; Lang, D.D.; Margolies, D.S.; Pickles, W.L.; Simonen, T.C. (Lawrence Livermore National Lab., CA (USA)). 26 Oct 1983. Contract W-7405-ENG-48. 6p. (CONF-831171—12). NTIS, PC A02/MF A01. Order Number DE84002722.

From American Vacuum Society meeting; Boston, MA, USA (1 Nov 1983).

Rate equations for the plasma species in a thermal barrier end plug establish an upper bound on the neutral pressure (P) external to the plasma. For the Tandem Mirror Experiment-Upgrade (TMX-U), this bound is $P \leqq 0.5 - 1.0 \times 10^{-6}$ Torr. Initially TMX-U did not satisfy this criterion, and axial end plugging of plasma losses seemed limited by the excessive pressure. Subsequently, we modified the machine to improve the vacuum conditions, decreasing P to the desired range. At the same time axial end plugging of plasma losses increased to the duration of neutral beam injection and ECRH heating. Here we summarize our experimental measurements of gas input.

4199 **(UCRL—89844) Photodetachment technology.** Fink, J.H. (Lawrence Livermore National Lab., CA (USA)). 1983. Contract W-7405-ENG-48. 16p. (CONF-831180—1). NTIS, PC A02/MF A01. Order Number DE84002727.

From 3. international symposium on the production and neutralization of negative ions and beams; Upton, NY, USA (14 Nov 1983).

This report gives an analysis of a neutral beam line formed of negative ions and stripped in a photoneutralizer. Estimates are made of its performance when neutralized by an atomic-iodine laser.

4200 **Helical axis stellarators with noninterlocking planar coils.** Reiman, A.H.; Boozer, A.H. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 11, 3167-3169(Nov 1983). Contract AC02-76CH03073.

The properties of helical axis stellarator fields generated by unlinked, planar coils are described. It is shown that such fields can have a magnetic well and large rotational transform, implying large equilibrium and stability beta limits.

4201 **Mass-ablation rates in a spherical laser-produced plasma.** Tarvin, J.A.; Fechner, W.B.; Larsen, J.T.; Rockett, P.D.; Slater, D.C. (KMS Fusion, Incorporated, Ann Arbor, Michigan 48106). *Physical Review Letters;* **51**: No. 15, 1355-1358(10 Oct 1983).

Measurements of the rate at which 1.05-μm light ablates material from spherical targets are reported for absorbed intensities between $4 \times 10^{13}$ and $4 \times 10^{14}$ W/cm². At $4 \times 10^{14}$, the ablation rate is twice as high as has been reported for planar targets. A steady-state model which includes inhibited thermal transport matches the data well.

4202 **Initial wall conditioning in Doublet III.** Jackson, G.L.; Clausing, R.E.; Lietzke, A.F.; Ejima, S.; Emerson, L.C.; Heatherly, L. (GA Technologies Inc., San Diego, California 92138). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **1**: No. 4, 1861-1867(Oct 1983). Contract AT03-76ET51011.

The first year of operation of Doublet III, a large noncircular tokamak (R = 1.43 m, a = 0.45 m, B/sub T/ < or =2.6 T), was highlighted by the achievement of a plasma current in excess of 2 MA. This is partially attributed to the low Z/sub eff/ discharges made possible by wall conditioning using low temperature, low power discharge cleaning, accompanied by preconditioning of the wall and by baking. Approximately 500 h of hydrogen discharge cleaning and 25 h of oxygen discharge cleaning combined with tokamak plasma operations were required to obtain these low Z/sub eff/ tokamak discharges. During the initial cleanup of the wall, copious quantities (>100 monolayers) of carbon were removed, ultimately with greatest efficiency by oxygen discharge cleaning. During the conditioning process, monitoring the impurity removal rate with the residual gas analyzer (RGA) provided the most understandable measure of the rate of the cleanup, while an in situ Auger analysis surface diagnostic supplied and operated by ORNL was most useful in identifying the presence of heavy hydrocarbons (oil), carbides, and oxygen on the wall and monitoring the transport of limiter materials.

4203 **Heat transport with cold and hot electrons allowing for flux limitation by Shvarts' method.** Shkarofsky, I.P. (MPB Technologies, Inc., Dorval, Quebec H9P 1J1, Canada). *Physics of Fluids;* **26**: No. 10, 3131-3137(Oct 1983). Contract AC08-81DP40162.

The analysis of Shkarofsky on hot-electron transport is extended to include a variable degree of collisionality and gradient scale length. An extended version of the method of Shvarts et al. [Phys. Rev. Lett. 47, 247 (1981)] is used whereby the perturbed electron velocity distribution is limited in magnitude to the unperturbed part when the former becomes larger than the latter. A Maxwellian distribution is adopted for the hot electrons. For the cold electrons, either a Maxwellian, [exp(-v²/v²/sub c/)], or an exp(-v⁵/v⁵/sub c/) variation is used. The heat flow has coefficients proportional to gradients in cold- and hot-electron density, to gradients in cold- and hot-electron temperature, and the free-streaming contribution. These contributions are summed for two sample sets of scale lengths. One set of results shows that in an intermediate range of collisionality, heat inhibition occurs, in that the flux limiter is decreasing substantially below the free-streaming value, rather than increasing monotonically towards the collisionless regime.

4204 **Intense relativistic electron beam injector system for tokamak current drive.** Bailey, V.L.; Creedon, J.M.; Ecker, B.M.; Helava, H.I. (Physics International Company, San Leandro, California 94577). *Journal of Applied Physics;* **54**: No. 4, 1656-1665(Apr 1983). Contract AM03-76SF00010.

We report experimental and theoretical studies of an intense relativistic electron beam (REB) injection system designed for tokamak current drive experiments. The injection system uses a standard high-voltage pulsed REB generator and a magnetically insulated transmission line (MITL) to drive an REB-accelerating diode in plasma. A series of preliminary experiments has been carried out to test the system by injecting REBs into a test chamber with preformed plasma and applied magnetic field. REBs were accelerated from two types of diodes: a conventional vacuum diode with foil anode, and a plasma diode, i.e., an REB cathode immersed in the plasma. REB current was in the range of 50 to 100 kA and REB particle energy ranged from 0.1 to 1.0 MeV. MITL power density exceeded 10 GW/cm². Performance of the injection system and REB transport properties is documented for plasma densities from 5 x $10^{12}$ to 2 x $10^{14}$ cm$^{-3}$. Injection system data are compared with numerical calculations of the performance of the coupled system consisting of the generator, MITL, and diode.

Abstract only. The full report is published in Nucl. Fusion (May 1982) v. 22(5) p. 671-719.

4206 **Engineering aspects of the INTOR design.** Shannon, T.E. (Oak Ridge National Lab., TN (USA)). pp 103-114 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/6).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

The INTOR engineering design has been strongly influenced by considerations for assembly and maintenance. A maintenance philosophy was established at the outset of the conceptual design to insure that the tokamak configuration would be developed to accommodate maintenance requirements. The main features of the INTOR design are summarized in this paper with primary emphasis on the impact of maintenance considerations. The most apparent configuration design feature is the access provided for torus maintenance. Particular attention was given to the size and location of superconducting magnets and the location of vacuum boundaries. All of the poloidal field (PF) coils are placed outside of the bore of the toroidal field (TF) coils and located above and below an access opening between adjacent TF coils through which torus sectors are removed. A magnet structural configuration consisting of mechanically attached reinforcing members has been designed which facilitates the open access space for torus sector removal. For impurity control, a single null poloidal divertor was selected over a double null design in order to maintain sufficient access for pumping and maintenance of the collector. A double null divertor was found to severely limit access to the torus with the addition of divertor collectors and pumping at the top. For this reason, a single null concept was selected in spite of the more difficult design problems associated with the required asymmetric PF system and higher parti-

cle loadings. Tokamak support systems and the reactor building and facilities are also important to the overall design evolution and were included in the conceptual design effort. However, this paper discusses only the primary tokamak systems.

4207 **Near-term tokamak reactor designs with high performance resistive magnets.** Cohn, D.R.; Bromberg, L.; Williams, J.E.C.; Becker, H.; Leclaire, R.; Yang, T. (Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). pp 173-184 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/11).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

A wide range of designs of near term tokamak reactors with high performance resistive magnets has been studied. High fields, obtainable in the near term only from resistive magnets, are used to provide high values of ntausub(E) and fusion power density, and to facilitate operation in the DD-DT advanced fuel mode. Magnet shielding requirements can be significantly reduced relative to those for superconducting magnets. Advanced Fusion Test Reactors (AFTR) designs have been developed using BITTER type magnets which are capable of steady state operation. The goals of compact AFTR designs (with major radii R approx.=2.5 - 4 m), include DT ignition with large physics margins; high duty cycle, long pulse operation; and DD-DT operation with low tritium concentration. Larger AFTR designs (R approx.=5m), have the additional goal of early demonstration of self sufficiency in tritium production. The AFTR devices could also serve as prototypes for commercial reactors. Compact ignition test reactors have also been designed (R approx.=1 - 2m). These designs use BITTER magnets that are inertially cooled starting at liquid nitrogen temperature. A detailed engineering design was developed for ZEPHYR.

4208 **Status of TFTR construction and proposed research plan.** Little, R. (Princeton Univ., NJ (USA). Plasma Physics Lab.). pp 221-228 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/14).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

TFTR is a large pulsed circular tokamak with R approx.=2.5 m, a approx.=1 m 20 copper TF coils producing an on-axis field of 5 T, and a large N.B. auxiliary heating system. The use of D-T plasma mixtures is a major goal of the project. TFTR is presently in a component fabrication phase, but is rapidly changing to the assembly and installation one. Facility buildings are close to completion and partial occupancy by PPL is in effect. All major components of the tokamak are in an advanced state of fabrication. The vacuum vessel is the critical-path item for initial plasma operation presently expected in August 82. One M.G. set is ready for test, but the second one was damaged in a crane failure. Other electrical components are being fabricated or installed. The present research plan incorporates an initial one-year period of ohmic heating and plasma control tests, and installation of three neutral beam injectors. There will be an extended period of optimizing the machine performance with hydrogen plasmas. This will include additional heating capabilities such as a fourth N.B. injector, ICRH coupler tests, and will last roughly two years. It will be followed by a demonstration D-T plasma effort, the aim being to achieve Q approx.=1 (a peak fusion output power equivalent to the N.B. input power). The next phase of experimentation will include major investigations which should be relevant to future machines. This phase includes a large ICRF heating system, pumped limiters, plasma current drive and longer pulse length operation, and will last two years by which time remote handling schemes will have been tested, and radiation shielding completed. The final phase will start in 1988 and concentrate on maximizing the D-T output from the tokamak. A lithium blanket module is being designed and will be installed for the demonstration D-T plasma effort.

4209 **Preconceptual design of hyfire. A fusion driven high temperature electrolysis plant.** Varljen, T.C.; Chi, J.W.H.; Karbowski, J.S. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Fusion Power Systems Dept.); Fillo, J.A.; Powell, J.M.; Benenati, R. (Brookhaven National Lab., Upton, NY (USA)). pp 313-323 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/18).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

Brookhaven National Laboratory has been engaged in a scoping study to investigate the potential merits of coupling a fusion reactor with a high temperature blanket to a high temperature electrolysis (HTE) process to produce hydrogen and oxygen. Westinghouse is assisting this study in the areas of systems design integration, plasma engineering, balance of plant design and electrolyzer technology. The aim of the work done in the past year has been to focus on a reference design point for the plant, which has been designated HYFIRE. In prior work, the STARFIRE commercial tokamak fusion reactor was directly used as the fusion driver. This report describes a new design obtained by scaling the basic STARFIRE design to permit the achievement of a blanket power of 6000 MWt. The high temperature blanket design employs a thermally insulated refractory oxide region which provides high temperature (>1000 deg. C) steam at moderate pressures to high temperature electrolysis units. The electrolysis process selected is based on the high temperature, solid electrolyte fuel cell technology developed by Westinghouse. An initial process design and plant layout has been completed; component cost and plant economics studies are now underway to develop estimates of hydrogen production costs and to determine the sensitivity of this cost to changes in major design parameters.

4210 **ELMO Bumpy Torus fusion reactor design study.** Bathke, C.G.; Krakowski, R.A. (Los Alamos National Lab., NM (USA)). pp 359-375 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/21).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

A complete power plant design of a 1200-MWe ELMO Bumpy Torus Reactor (EBTR) is described that emphasizes those features that are unique to the EBT confinement concept, with subsystems and balance-of-plant items that are generic to magnetic fusion being adopted from past, more extensive tokamak reactor designs.

4211 **Compact-Toroid Fusion Reactor (CTOR) based on the field reversed theta pinch.** Hagenson, R.L. (Technology International, Inc., Ames, IA (USA)); Krakowski, R.A. (Los Alamos National Lab., NM (USA)). pp 377-390 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/22).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

Scoping studies of a translating Compact Torus Reactor (CTOR) have been made on the basis of a dynamic plasma model and an overall systems approach. This CTOR embodiment uses a Field-Reversed Theta Pinch as a plasma source. The field-reversed plasmoid would be formed and compressionally heated to ignition prior to injection into and translation through a linear burn chamber, thereby removing the high-technology plasmoid source from the hostile reactor environment. Stabilization of the field-reversed plasmoid would be provided by a passive conducting shell located outside the high-temperature blanket but within the low-field superconducting magnets and associated radiation shielding. On the basis of this batch-burn but thermally steady-state approach, a reactor

concept emerges with a length below approx. 40 m that generates 300-400 MWe of net electrical power with a recirculating power fraction less than 0.15.

4212 **Recent studies of reversed-field pinch reactors.** Hagenson, R.L. (Technology International, Inc., Ames, IA (USA)); Krakowski, R.A. (Los Alamos National Lab., NM (USA)). pp 391-406 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/23).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

The reactor prognoses of a class of confinement schemes that rely primarily on self-fields induced by axial currents flowing within a plasma column are presented. The primary focus has been placed on the toroidal Reversed-Field Pinch (RFP). At the limit of very large current densities is the gas-embedded Dense Z-Pinch (DZP), a small-radius, linear device. Past "conventional" RFP reactor designs are reviewed. The extension of these "conventional" RFP reactors to DD advanced-fuel operation is described. The implications are summarized of operating higher-density, compact RFPs as reactors, wherein the current density rather than physical dimensions are scaled. Lastly, the application of very high current densities supported in a sub-millimeter linear current channel, as embodied in the DZP reactor, is reviewed.

4213 **Designs of tandem mirror fusion reactors.** Carlson, G.A.; Barr, W.L.; Boghosian, B.M. (California Univ., Livermore (USA). Lawrence Livermore National Lab.) (and others). pp 443-456 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/26).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

We have completed a comparative evaluation of several end plug configurations for tandem mirror fusion reactors with thermal barriers. The axi-cell configuration has been selected for further study and will be the basis for a detailed conceptual design study to be carried out over the next two years. The axi-cell end plug has a simple mirror cell produced by two circular coils followed by a transition coil and a yin-yang pair, which provides for MHD stability.

4214 **Westinghouse ICF power plant design.** Sucov, E.W. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Fusion Power Systems Dept.). pp 515-526 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/30).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

This study of commercial power plants based on ICF drivers examined the technological problems that need to be confronted and solved in order to produce commercially competitive electricity acceptable to utilities. Two conceptual designs, one based on a $CO_2$ laser driven and one on a heavy ion particle beam driver, were developed. Analytic descriptions of the performance and cost relationships for each of the subsystems that comprise the power plant were combined into an overall computer code which modeled the entire plant and permitted trade studies to be conducted. The subsystems of the power plants include driver, pellet fabrication, pellet injection, first wall protection, first wall and structure, heat removal, tritium breeding, neutron shielding, maintenance and repair. The emphasis of the effort was on designing a viable reactor cavity and on solving the problems of interfacing the driver systems with the reactor cavity. Averaged surface heating due to X-ray and ion pulses from the pellet explosion is carried away by flowing lithium in tubes of HT-9 steel, which constitute the first wall. Protection of the first wall against the extreme temperature transients caused by these pulses is provided by a thin Ta coating. Analysis of these transients using a hydrodynamic and radiation transport code coupled with realistic equations of state for the Ta show: (1) the maximum temperature reached by the tantalum surface is 400 K below its melting point so spallation and evaporation are unlikely, and (2) the high temperatures do not penetrate deeply into the coating so there will be little thermal cycling at the steel-tantalum interface. This "dry wall" protection concept is uniquely compatible with beam transport requirements of all ICF drivers including lasers, light ions and heavy ions.

4215 **DTHR and CTHR: A review of two recent tokamak fusion-fission hybrid reactor design studies.** Varljen, T.C.; Rose, R.P. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Fusion Power Systems Dept.). pp 529-543 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/31).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

This paper describes the results of two recent reactor design studies for a Demonstration Tokamak Hybrid Reactor (DTHR) and a Commercial Tokamak Hybrid Reactor (CTHR). The DTHR is envisioned as a relatively near term engineering demonstration of hybrid feasibility. The tokamak driver was derived from prior TNS studies and is similar in many respects to current FED/ETF/INTOR concepts. The tokamak employs an elongated plasma with major and minor radii of 5.2 and 1.2 m, respectively. The toroidal and poloidal field coil systems both use superconducting $Nb_3Sn$ windings. A bundle divertor is used for plasma exhaust and impurity control. The DTHR blanket could be used as a test bed for a number of blanket concepts simultaneously. The reference concept is based on uranium or thorium oxide based fertile material and water cooling to take maximum advantage of existing LWR technology in this early demonstration. The reference CTHR design is intended to represent an integrated first generation (but not first-of-a-kind) commercial fusion-fission hybrid plant which is a logical extension of the state of the art of both the fusion driver and hybrid blanket technologies. While the groundrules of this study were quite similar to those used for STARFIRE, the approach taken in the CTHR work was somewhat more conservative in terms of plasma physics and the performance and cost of components.

4216 **Feasibility study of a fission suppressed blanket for a tandem mirror hybrid reactor.** Moir, R.W.; Lee, J.D.; Barr, W.L. (California Univ., Livermore (USA). Lawrence Livermore National Lab.) (and others). pp 545-567 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/32).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

A study of fission suppressed blankets for the tandem mirror not only showed such blankets to be feasible but also to be safer than fissioning blankets. Such hybrids could produce enough fissile material to support up to 17 light water reactors of the same nuclear power rating. Beryllium was compared to $^{7}Li$ for neutron multiplication; both were considered feasible but the blanket with Li produced 20% less fissile fuel per unit of nuclear power in the reactor. The beryllium resource, while possibly being too small for extensive pure fusion application, would be adequate (with carefully planned industrial expansion) for the hybrid because of the large support ratio, and hence few hybrids required. Radiation damage and coatings for beryllium remain issues to be resolved by further study and experimentation. Molten salt reprocessing was compared to aqueous solution reprocessing (thorex and purex). The cost of bred fissile material ($^{233}U$) expressed as an equivalent $U_3O_8$ cost was $89/lb for the Li case with molten salt reprocessing, $76/lb for the beryllium case with aqueous reprocessing, and $63/lb for the beryllium-molten salt design. $75/lb for $U_3O_8$ is equivalent to $50-60/g of $^{233}U$. A hybrid whose nuclear power rating is 4000 MW can produce 6000 kg/y of $^{233}U$. This is enough to provide make up

fuel for 15 LWR's containing no thorium (only $^{238}U$ plus recycled $^{233}U$ and $^{239}Pu$) each rated at 4000 MW nuclear. The system of 15 LWR's plus 1 hybrid (estimated to cost 3.5 times that of an LWR) would produce electricity at a cost of less than 10% more than an LWR which bought $U_3O_8$ at $45/lb. The electricity would cost the same for an LWR using $U_3O_8$ costing $75/lb.

4217 **Low activation fusion reactor design.** Hopkins, G.R.; Cheng, E.T.; Wong, C.P.C.; Maya, I.; Schultz, K.R. (General Atomic Co., San Diego, CA (USA)). pp 569-579 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/33).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

One of the primary reasons for development of fusion energy is the potential fusion has to provide an inherently safe source of nuclear energy. The fusion process, however, releases a highly energetic neutron which will create radioactive activation products in the material surrounding the plasma. Assessment of the amounts of radioactivity indicate they can be similar to those of a fission reactor. A unique aspect of the radioactivity associated with fusion is that it is not inherent to the fusion reaction. By choosing low activation materials such as aluminum, beryllium, silicon carbide, carbon, lithium oxide, helium and water, the radioactivity can be reduced by factors of more than a million below that of a fission reactor. We have done a design study to investigate the implications of using low activation materials in a fusion power reactor. The STARFIRE reactor was used as a model. Low activation design concepts were studied for the four major regions of a fusion reactor: first wall and limiter, blanket, shield, and magnet windings. The first wall and limiter are made of water-cooled aluminum. The blanket uses an unpressurized silicon carbide structure containing $Li_2O$ breeding material with high temperature, high pressure helium coolant contained in SiC "thimble tubes". The shield is made of SiC and $B_4C$ with an aluminum structure. The superconducting magnets use an aluminum stabilizer and aluminum or carbon fiber epoxy composite for the structure and dewar. Analysis of the design indicates that the activation and dose rate levels and the quantities of radioactive material to be disposed of are reduced by up to six orders of magnitude compared to the reference design. Although access to the plasma chamber is not possible, contact maintenance at the back of the blanket would be allowed. The low activation concept can thus allow fusion to provide an inherently safe and environmentally acceptable source of energy with a low level of residual radioactivity.

4218 **Advanced fuel concepts and applications.** Miley, G.H. (Illinois Univ., Urbana (USA). Fusion Studies Lab.). pp 15-28 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/36).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

Despite their more stringent plasma heating and confinement requirements, advanced fuel (AF) fusion cycles potentially offer improved environmental compatibility and lower costs. This comes about by elimination of tritium breeding requirements and by a reduction in neutron flux (hence, activation and radiation damage). Also a larger energy fraction carried by charged particles makes direct energy conversion more suitable. As a first application, a symbiotic system of semi-catalyzed-deuterium fueled hybrid fuel factories, supplying both fissile fuel to light water reactors and $^3He$ to D-$^3He$ "satellite" fusion reactors, is proposed. Subsequently, an evolution into a system of synfuel factories with satellite D-$^3He$ reactors is envisioned.

4219 **First wall and blanket engineering development for magnetic fusion reactors.** Baker, C.; Herman, H.; Maroni, V.; Turner, L.; Clemmer, R.; Finn, P.; Johnson, C.; Abdou, M. (Argonne National Lab., IL (USA)). pp 115-135 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/43).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

The purpose of the First Wall/Blanket/Shield (FW/B/S) Engineering Test Program is to establish an engineering data base derived from realistic models and facsimile testing. The program defines the performance characteristics for the Fusion Engineering Device (FED) and a Fusion Demonstration Plant (FDP). The first wall element is concerned with thermo-mechanical testing. Tests are being conducted for normal heat flux conditions (10-100 W/cm$^2$) and off-normal conditions such as plasma disruptions (100-300 MW/m$^2$). The blanket element is concerned with studies on how to simulate fusion neutron bulk heating effects in blankets using non-nuclear techniques and fission reactors. In addition, a facility is being constructed at ANL for electromagnetic testing of FW/B/S components. The assembly/maintenance/repair (AMR) element of the program is now focusing on preparation of a designer's guide book and development of vacuum and coolant penetrations and connectors. Industrial participation in this activity includes Westinghouse Electric Corporation; General Atomic Company; EG and G Idaho, Inc.; McDonnell Douglas Astronautics Company (MDAC); and Remote Technology Corporation. Current activities in the breeder blanket development program are focused on a number of solid breeders and include: (1) preparation and fabrication; (2) measurement of thermochemical properties and phase equilibria; (3) studies of compatibility of candidate structural materials with solid breeders; (4) determination of thermal diffusivity and thermal conductivity; and (5) small-scale neutron irradiation and tritium extraction tests for $Li_2ZrO_3$ and $Li_2TiO_3$.

4220 **Progress in engineering simulation testing of fusion reactor first wall components.** Varljen, T.C.; Chi, J.W.H. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Fusion Power Systems Dept.); Herman, H. (Argonne National Lab., IL (USA)). pp 137-148 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/44).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

Test Program Element -I (TPE-I) of the First Wall/Blanket/Shield Engineering Test Program conducted by the Argonne National Laboratory will focus on providing experimental facilities and the conduct of experiments required to develop the data base necessary to design first wall and limiter systems for fusion reactor applications. Initial first wall experiments are scheduled to begin in October, 1981. This paper is a summary of the plans which have been developed for this program and a status report on the preparation of the facilities designed to provide a suitable testing environment. The Fusion Power Systems Department of the Westinghouse Electric Corporation is the lead industrial participant for TPE-I. Two test facilities will be implemented, both based on the use of high power electron beams to provide surface heat loads in the range of interest for fusion reactor applications. The initial focus of the test program will be primarily on the thermal-hydraulic and thermal-mechanical response of candidate first wall and limiter components to high surface heat loads, excluding, for the time being, such additional effects as surface erosion, sputtering and radiation damage. The first series of first wall component tests have been planned and four types of test pieces have been designed and are now being fabricated. These test pieces are based on current Fusion Engineering Device (FED) first wall and limiter concepts. Both steady state and rapid transient (disruption) heat loads will be applied to these test articles, bracketing FED operating conditions. A program of metallographic examination has also been planned to

correlate structural and microstructural changes with the imposed head loads.

4221 **Cyclic thermal stresses in fusion reactors.** Bohachevsky, I.O. (Los Alamos National Lab., NM (USA)); Kostoff, R.N. (Department of Energy, Washington, DC (USA). Office of Energy Research). pp 149-160 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/45).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

In this paper we model and analyze cyclic thermal loads and stresses in two critical components of inertial and magnetic confinement fusion reactors (including fusion-fission hybrids); namely, in the solid wall adjacent to the fusion plasma ("first wall") and in the fuel elements located in the high power density region of the blanket. We derive explicit expressions for the parametric dependencies of thermal stresses that provide a quantitative basis for tradeoff and comparative assessment studies of different fusion reactors.

4222 **Fusion materials. Adapting to realistic reactor environments.** Kulcinski, G.L. (Wisconsin Univ., Madison (USA). Dept. of Nuclear Engineering). pp 353-376 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/60).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

There has been considerable movement in the fusion materials field since the last International Workshop on Reactor Design was held in Madison (1977). Some of the movement has been forward: e.g., we now have much better theoretical descriptions of the melting, vaporization, and electromechanical stresses imposed on first wall material during plasma disruptions. Some of the movement has been "sideways", e.g., the Fusion Materials Irradiation Test Facility (FMIT) now has slipped 3 years in its schedule since the last conference 4 years ago. Finally, there has been very little progress in the fields of pulsed damage simulation for Inertial Confinement Fusion (ICF) Systems, definition of the radiation spectra from ICF targets, or the experimental determination of disruption characteristics for magnetic fusion devices. Several new ideas have appeared since 1977 such as the use of low swelling martensitic alloys, the use of a much more favorable breeding material, $Pb_{83}Li_{17}$, and there have been two major efforts to design materials test facilities: INTOR and TASKA.

4223 **Critical plasma-materials issues for fusion reactor designs.** Wilson, K.L.; Bauer, W. (Sandia National Labs., Livermore, CA (USA)). pp 377-387 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/61).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

Plasma-materials interactions are a dominant driving force in the design of fusion power reactors. This paper presents a summary of plasma-materials interactions research. Emphasis is placed on critical aspects related to reactor design. Particular issues to be addressed are plasma edge characterization, hydrogen recycle, impurity introduction, and coating development. Typical wall fluxes in operating magnetically confined devices are summarized. Recent calculations of tritium inventory and first wall permeation, based on laboratory measurements of hydrogen recycling, are given for various reactor operating scenarios. Impurity introduction/wall erosion mechanisms considered include sputtering, chemical erosion, and evaporation (melting). Finally, the advanced material development for in-vessel components is discussed.

4224 **Safety considerations in fusion reactor design.** Crocker, J.G. (Idaho National Engineering Lab., Idaho Falls (USA)). pp 413-427 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vienna, Austria; International Atomic Energy Agency (1983). (CONF-811046—Vol.1; IAEA-TC—392/64).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

Nuclear fusion as a source of commercial power is on the threshold of the transition from scientific experimentation to commercial application. This transition is marked by the increased attention that will be given to engineering experiments in the next generation of fusion devices. This transition will also be accompanied by the introduction of experiments that make significant use of the deuterium-tritium (D-T) reaction. The use of the D-T reaction in fusion reactor designs results in several safety problems that must be resolved in the reactor design process. The most significant safety issues for D-T burning reactors involve minimization and control of radioactive inventories. These inventories are tritium and activation products that are produced by the interaction of fusion reactor materials with high energy neutrons produced in the fusion reaction. Some of the more significant design issues arising from the presence of these inventories include 1) minimizing the radioactive inventories, 2) control of routine and accidental releases, 3) shielding, 4) containment design, 5) maintenance in high radiation environment, 6) instrumentation, and 7) waste management. Current fusion reactor designs involve a complex interaction of systems required for confinement, heating and control of the plasma, tritium breeding, heat removal, energy conversion, shielding, and maintenance. Many of these systems contain large quantities of stored energy that potentially could result in radioactive release under certain accident conditions. This paper discusses key safety issues involved with D-T burning fusion reactor designs and design solutions that can be employed to eliminate or reduce the potential for adverse consequences to operating personnel, the general public, and the environment.

4225 **UWTOR-M, a stellarator power reactor utilizing modular coils.** Sviatoslavsky, I.N.; Van Sciver, S.W.; Kulcinski, G.L. (Wisconsin Univ., Madison (USA). Dept. of Nuclear Engineering). pp 327-342 of Fusion reactor design and technology. Proceedings of the third technical committee meeting and workshop organized by the IAEA and held in Tokyo, Japan, 5-16 October 1981. Vol. 1. Vienna, Austria; IAEA (1983). (CONF-811046—; IAEA-TC—392/19).

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

A preliminary design of a 5500 MWsub(th) modular stellarator power reactor, UWTOR-M, is presented. We briefly describe the parametric considerations which led to the UWTOR-M reference design point. The design has 18 twisted coils utilizing a multipolarity of 3, a major radius of 24 m, a coil radius of 4.77 m and a plasma aspect ratio of 14. An assumed $\beta$ of 5% was used. This configuration leads to a rotational transform on the edge of 1.125 giving favourable plasma physics conditions. The natural stellarator divertor is used for impurity control in conjunction with innovative high performance divertor targets. A unique blanket design is proposed which minimizes tritium inventory in the reactor. Finally, since maintainability is a prime consideration, we describe a scheme for servicing the first wall/blanket and other reactor components.

4226 **Experimental investigation of the spheromak configuration.** Yamada, M.; Ellis, R. Jr.; Furth, H.P. (Princeton Univ., NJ (USA). Plasma Physics Lab.). pp 265-280 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/M-1).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

The characteristics of the spheromak configuration have been intensively investigated on the basis of three different formation schemes. Significant progress has been obtained in the areas of control of gross MHD instability and impurity influx. The parameters of spheromak plasmas have been improved and are in the range of Bsub(t) approx.= Bsub(p) <or approx. 5kG, Tsub(e) <or approx. 50eV, $3x10^{13}$ <nsub(e)< $10^{15}cm^{-3}$, with the longest lifetime of 1 ms.

4227 **Inertial fusion research based on pulsed power.** Yonas, G. (Sandia National Labs., Albuquerque, NM (USA)). pp 353-360 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/N-1).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

PBFA II, with design parameters of 3.5 MJ and 100 TW, is being designed to allow inertial fusion ignition experiments using imploding foils or light ion beams. Flexibility is being retained to implode a cylindrical foil through magnetically insulated power concentration at 30 MA or to drive one or more ion diodes operating in the 10 MV range. In both cases the goal is to deliver 100 $TW.cm^{-2}$ and 1 MJ to a target in order to investigate ignition and possibly breakeven. Imploding foil data on Proto II have demonstrated that electromagnetic energy can be efficiently converted into foil kinetic energy with the output increasing as the square of the foil current. Experiments at Sandia National Laboratories have reached 60 kJ at 5 MA with the foil imploding in 80 ns and stagnating in 10 ns. This implosion demonstrates adequate stability, and modelling has shown that this behaviour should extrapolate to higher currents if the implosion time is less than 100 ns. To extend the scaling data to 8 MA, Proto II has been modified by extending magnetic insulation to inhibit insulator flashover. One-TW proton diodes have delivered about 2 $TW.cm^{-2}$ to 3 mm diameter targets using ballistic focusing limited by beam divergences of typically 20 mrad. This divergence is induced by instabilities in the electron-ion flow, non-uniformities in the anode plasma, or a combination of these effects. Further increases in intensity can be achieved with increases in voltage and ion mass, as well as with beam bunching. Analytical models indicate that beam focusing increases with the square of the voltage and that heavier ions such as $C^{+2}$ or $Li^{+1}$ are required to obtain the correct stopping power at >10 MV. Correlation with analytical scaling models and electromagnetic code simulations is continuing. PBFA II will be capable of operating over a wide voltage range to accommodate the different options, with scaling experiments on PBFA I providing the basis for the selection.

4228 **Light-ion inertial confinement fusion research at Naval Research Laboratory.** Cooperstein, G.; Colombant, D.G. (Naval Research Lab., Washington, DC (USA)); Barker, R.J. (JAYCOR, Alexandria, VA (USA)). pp 361-369 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/N-2).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

High-brightness proton beams (0.4 MA, 1 MV) have recently been extracted from 20 $cm^2$ axial pinch-reflex diodes (PRDs) mounted on the NRL Gamble II generator. A source power brightness of >=10 $TW.cm^{-2}.rad^{-2}$ was achieved in these experiments. A new barrel-shaped equatorial PRD that can be coupled to PBFA II has also been operated on Gamble II and has demonstrated 50% proton efficiency with predominantly azimuthally symmetric charged-particle flow. In other experiments the stopping power of deuterons in hot plasmas was measured using a PRD on Gamble II. Results show about 40% increase in stopping power over that in cold targets when the beam was focused to about 0.25 $MA.cm^{-2}$. Research is also being performed on transporting ion beams in large-diameter channels (>or approx. 2.5 cm) and on a post-transport plasma-filled magnetic focusing section to bring the beam to pellet dimensions.

4229 **Research progress in intense ion beam production for inertial confinement fusion at Cornell University.** Bluhm, H.; Greenly, J.B.; Hammer, D.A. (Cornell Univ., Ithaca, NY (USA). Lab. of Plasma Studies). pp 371-380 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/N-3).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

Recent results obtained in the generation of intense pulsed light ion beams and their application to inertial confinement fusion are described. Studies of time-integrated and time-dependent beam divergence using a magnetically insulated ion diode with a "flashboard" anode at <or approx.$10^{11}$ W diode power show a directionality which is apparently due to electron dynamics in the diode. Nevertheless, ion beams having divergence angle as small as 0.5° have been produced at $>10^{8}$ $W.cm^{-2}$. In another experiment with a similar diode, the anode plasma formation time varied with the detailed anode configuration, the diode voltage and the insulating magnetic field, with the longer times obtained at lower voltage and higher insulating magnetic field strength. The anode plasma density was determined to be in the $10^{15}$ $cm^{-3}$ density range and to move away from the anode at approx.2 $cm.\mu s^{-1}$ in another similar experiment. Preliminary experiments performed on a $10^{12}$ W accelerator show reasonable power coupling to a magnetically insulated ion diode, with $>10^{9}$ $W.cm^{-2}$ beams at approx.1.5 MV being generated. Computer simulations suggest that if such a beam can be focused into a plasma channel, most of its energy can be delivered to a pellet one to two metres away. In experiments on the applied Bsub(theta) diode, microwave radiation, ion production efficiency, and ion beam fluctuations all reach a maximum when the insulating magnetic field is about 1.4 times the critical field for magnetic insulation. Relatively pure beams of heavy ions have been produced by making the anode with hydrocarbon-free dielectric material. The sum of these results suggests that flashboard anodes operated at the few-MV level can be used to produce beams with properties suitable for inertial confinement fusion experiments on sufficiently powerful pulsed power generators.

4230 **Development of hydrogen pellet injectors and pellet fuelling experiments at Oak Ridge National Laboratory.** Milora, S.L.; Combs, S.K.; Foster, C.A. (Oak Ridge National Lab., TN (USA)). pp 461-470 of Plasma physics and controlled nuclear fusion research 1982. Proceedings of the ninth international conference on plasma physics and controlled nuclear fusion research held by the IAEA in Baltimore, 1-8 September 1982. Vol. 2. Vienna, Austria; IAEA (1983). (CONF-820930—; IAEA-CN—41/O-3).

From 9. international conference on plasma physics and controlled nuclear fusion research (IAEA); Baltimore, MD, USA (1 Sep 1982).

The introduction of high-speed hydrogen and deuterium pellet injectors of multipellet capability has allowed pellet fuelling experiments to progress beyond the demonstration stage. The paper describes various aspects of the Oak Ridge National Laboratory Pellet Fueling Program, including the development of pneumatic and mechanical (centrifugal) injector types, plasma fuelling experiments, and the numerical results of pellet ablation and transport studies.

4231 **(LA-tr—83-21) Production of negative $D^-$ ions by double charge exchange using cesium.** Delaunay, M.; Geller, R.; Jacquot, C.; Ludwig, P.; Mazhari, F.; Rocco, J.C.; Sermet, P.; Zadworny, F. (Los Alamos National Lab., NM (USA); Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Groupe de Recherches sur la Fusion Controlee). 1983. Contract W-7405-ENG-36. Translation of EUR-CEA-FC-1096, March 1981. 62p. NTIS, PC A04/MF A01. Order Number DE84002816.

The first experimental results on the source of $D^-$ negative ions developed at SIG confirm a certain number of essential points: (1) the use of a positive ion source obtained by a resonance electronic cyclotron permits the production of $D^+$ ion beams with a very small gas output, therefore it has a very good gas efficiency; (2) the supersonic cesium target obtained after the release of a high temperature cesium vapor functions perfectly with the desired characteristics; (3) the conversion efficiency measured in $D^-$ ions is close to those which were deduced from experimental cross sections; and (4) the mean density of $D^-$ ion currents is on the order of 10 mA/cm² at 1 keV. They could be 15 at 25 mA/cm² at 300 eV. This presupposes that we modify the extraction optic for the $D^+$ ions to extract 60 at 70 mA/cm² of $D^+$ at 300 eV with a maximum electric field of 30 DV/cm and a greater perveance of the optic. (MOW)

4232 **Large aperture harmonic conversion experiments at Lawrence Livermore National Laboratory.** Linford, G.J.; Johnson, B.C.; Hildum, J.S.; Martin, W.E.; Snyder, K.; Boyd, R.D.; Smith, W.L.; Vercimak, C.L.; Eimerle, D.; Hunt, J.T. (All authors were with University of California, Lawrence Livermore National Laboratory, P.O. Box 808, Livermore, California 94550 when this work was done; G. J. Linford is now with Max-Planck-Institut fur Quantenoptik, D-8046 Garching, Federal Republic of Germany.). *Applied Optics;* **21**: No. 20, 3633-3643(15 Oct 1982). Contract W-7405-ENG-48.

Large aperture harmonic conversion experiments to $2\omega$ (532 nm), $3\omega$ (355 nm), and $4\omega$ (266 nm) on the Argus laser at the Livermore National Laboratory are described. Harmonically converted energies of up to 346 J have been generated at external conversion efficiencies of 83%. A discussion of the harmonic conversion experiments and a brief summary of enhanced $2\omega$ and $3\omega$ inertial confinement fusion target performances are provided.

4233 **Interactions between the line-connected static convertors of TEXTOR.** Griesen, B. (Association Euratom-Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)); Petree, F. (Ebasco Services, Inc., New York (USA)). pp 915-919 of Fusion technology 1980. Vol. 2. Oxford, England; Pergamon Press (1981). (CONF-800950—Vols.1,2; EUR—7035).

From 11. symposium on fusion technology; Oxford, UK (15 Sep 1980).

In two volumes.

This paper describes techniques used to predict and analyze the potentially harmful effects of interactions between three high-power static convertors connected to a high impedance distribution transformer, to weigh them against the benefits.

4234 **Grounding system of TEXTOR.** Schwarz, U. (Association Euratom-Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)); Neumeyer, C. (Ebasco Services, Inc., New York (USA)). pp 921-926 of Fusion technology 1980. Vol. 2. Oxford, England; Pergamon Press (1981). (CONF-800950—Vols.1,2; EUR—7035).

From 11. symposium on fusion technology; Oxford, UK (15 Sep 1980).

In two volumes.

The modular design of the TEXTOR grounding system is described. The resistive grounding of major components is treated in detail. An insulation test procedure is proposed by using the grounding system.

4235 **TRAIL - a tokamak rail gun limiter.** Yu, W.S.; Powell, J.R.; Usher, J.L. (Brookhaven National Lab., Upton, NY (USA)). pp 1059-1066 of Fusion technology 1980. Vol. 2. Oxford, England; Pergamon Press (1981). (CONF-800950—Vols.1,2; EUR—7035).

From 11. symposium on fusion technology; Oxford, UK (15 Sep 1980).

In two volumes.

An attractive new limiter concept is investigated. The TRAIL (Tokamak Rail Gun Limiter) system impacts a stream of moderate velocity pellets (100 to 200 m/sec) through the plasma edge region to absorb energy and define the plasma boundary. The pellets are recycled after cooling, to the injector of an E-M mass accelerator. Heat fluxes of approx. 30,000 W/c.m² can be readily accommodated by the pellets, with very low recirculating power requirements (approx. 0.1%) for the accelerator. The mass accelerator velocity requirements are well within the present state of the art (several Km/sec). Accelerators injecting pellets at approx. 1 Km/sec can be used to control local plasma temperature and current profiles and to act as energy absorbers to shut down the plasma without damage to the first wall if a plasma disruption occurs.

## 99 GENERAL AND MISCELLANEOUS

4236 **(BNL—33767) History and ritual events on a Petexbatun Classic Maya polychrome vessel.** Reents, D.J.; Bishop, R.L. (Brookhaven National Lab., Upton, NY (USA); Texas Univ., Austin (USA)). 12 Jun 1983. Contract AC02-76CH00016. 22p. (CONF-8306140—1). NTIS, PC A02/MF A01. Order Number DE84001773.

From Quinta Mesa Redonda de Palenque conference; Palenque, Mexico (13 Jun 1983).

Portions are illegible in microfiche products.

A discussion is presented of the historical ritual bloodletting which is represented on the Late Classic Maya polychrome vessel MS0651. (DLC)

4237 **(BNL—33772) Area group: an example of style and paste compositional covariation in Maya pottery.** Bishop, R.L.; Reents, D.J.; Harbottle, G.; Sayre, E.V.; van Zelst, L. (Brookhaven National Lab., Upton, NY (USA); Texas Univ., Austin (USA). Dept. of Art History; Museum of Fine Arts, Boston, MA (USA). Research Lab.). 12 Jun 1983. Contract AC02-76CH00016. 24p. (CONF-8306140—2). NTIS, PC A02/MF A01. Order Number DE84001669.

From Quinta Mesa Redonda de Palenque conference; Palenque, Mexico (13 Jun 1983).

This paper has addressed aspects of ceramic style and iconography as found in Late Classic Maya ceramic art, including the supplemental perspective afforded by the analysis of ceramic paste. The chemical data provide a means to assess the extent of stylistic-paste compositional covariation. Depending upon the strength of that covariation various inferences may be drawn about craft specialization, exchange and information flow within Maya society. At the least, it provides an empirical means of comparing stylistically similar vessels; and when they are members of a chemically homogeneous group, it permits style to be addressed in terms of its variation. Additionally, compositionally defined site or region specific reference units provide a chemical background against which the non-provenienced vessels may be compared, allowing the whole vessels to be related to the archaelogically recovered fragmentary material. Finally, this multidisciplinary approach has been illustrated by preliminary findings concerning a specific group of polychrome vessels, The Area Group.

4238 **(DOE/ER/10058—T1) Energy Research Program. Final report, 1 September 1976-28 February 1982.** (California Inst. of Tech., Pasadena (USA)). 1982. Contract FG03-76ER10058. 262p. NTIS, PC A12/MF A01. Order Number DE83017906.

Portions are illegible in microfiche products.

Research was performed in six areas: geochemical studies applied to development of energy resources (ability to locate resources, characterization of geothermal fluids); molecular processes associated with energy production, storage, and utilization (isotope

separation, lasers, catalysis, combustion, solar energy utilization); fluid mechanics, thermodynamics, and combustion; solar cell materials; radiation damage processes relevant to energy technology; and energy-related environmental and economic policy studies. Reports on these six areas are presented in this document. (DLC)

## 9901 Management

4239 **(CONF-8309125—2) Clarity in writing and editing.** Nelson, O.A. (Westinghouse Electric Corp., Madison, PA (USA)). 1983. Contract AC15-76CL50003. 10p. NTIS, PC A02/MF A01. Order Number DE84002805.

From Annual practical conference on communication; Knoxville, TN, USA (29 Sep 1983).

Writing is for reading. If you write or edit in such a way that the message is understood the first time it is read, you have succeeded where many people fail. Two ways to achieve such clarity are: 1) use commonly understood language whenever you can; 2) when you have to use special terms, define them effectively. The first way involves choice of vocabulary, appropriate technical level, and good mechanics. Definitions need to be clear, concise, and unobtrusive statements of what the terms defined mean in the context of your writing.

4240 **(DOE/EP/16004—T1) Draft issue of proposed document entitled Management Program to Assure Quality.** (NUS Corp., Gaithersburg, MD (USA)). 11 Nov 1983. Contract AC01-83EP16004. 4p. NTIS, PC A02/MF A01. Order Number DE84002286.

Material related to the existing DOE Management Program to Assure Quality was reviewed. A proposed Management Program to Assure Quality (MPAQ) document is outlined as follows: (1) Quality Assurance Policy Statement by Under Secretary; the Policy Statement will promulgate a DOE policy on QA and mandate each Program Secretarial Office preparing a formal QA program; (2) Foreword; (3) Background, (a) QA Philosophy, (b) DOE policy related to QA, (c) Purpose of MPAQ; (4) Program Development Methodology; this section will detail the process for developing a QA program tailored to the needs of the specific organization; (5) Essential Quality Assurance Elements; and appendices.

4241 **(EUR—8049-EN-Pt.2) Selection of an energy R and D portfolio for the European Community. Part II. A data handbook of probability assessments for energy technologies.** Love, P.E.; Michel, J. (Energy Management Centre, New York (USA); Laboratoires d'Electronique et de Physique Appliquee (LEP), 94 - Limeil-Brevannes (France)). 1983. 206p. European Community Information Service, 2100 M Street, NW, Suite 707, Washington, DC 20037.

This is an introductory exercise that looks at the use of stochastic methods as an aid to allocating resources for RD and D in the energy field. The majority of models currently developed for energy planners are usually based upon macro energy/economic linear programs. Sensitivity runs are costly and require an expert interface between the customer and the program. The macro approach does not always answer questions regarding RD and D resource allocation. Seeking to alleviate these problems lead to the development of a simple stochastic model. This form of analysis is not meant to provide detailed insights into the operation of the energy system as a whole. Its primary role is to focus upon some specific area of concern, whilst tacitly accepting the vagaries of the energy scene and dealing with them in an economical and consistent manner in order to explicitly reveal the uncertainties involved. The development of an appropriate data base provides assessments of the probabilities involved.

4242 **(LA—9875-MS) Probabilistic planning and budgeting for R & D programs involving activities of high uncertainty.** Nunz, G.J. (Los Alamos National Lab., NM (USA)). Sep 1983. Contract W-7405-ENG-36. 30p. NTIS, PC A03/MF A01. Order Number DE84002310.

A methodology is developed for probabilistic planning and budgeting in programs containing large elements of uncertainty. The model uses PERT-type temporal network analysis as a stochastic scheduling basis. Linear time dependencies are assigned to activity resources expenditures, which are combined to develop the parameters of total program budget and manpower requirement distributions. Bivariate analysis is then conducted of the joint distributions of manpower against schedule and total cost against schedule in the form of covariance ellipses. Sanguine commentary is also provided on the usefulness and pitfalls of this approach.

4243 **(ORNL—5933) Chemical Technology Division progress report for the period April 1, 1981-March 31, 1983.** (Oak Ridge National Lab., TN (USA)). Sep 1983. Contract W-7405-ENG-26. 178p. NTIS, PC A09/MF A01. Order Number DE84000647.

Separate abstracts were prepared for eight sections of the report: nuclear waste management; fossil energy; basic science and technology; biotechnology and environmental programs; transuranium-element processing; Nuclear Regulatory Commission programs; Three Mile Island support studies; and miscellaneous programs.

4244 **Roadmap for complex decisions.** Douglas, J.; Richels, R. *EPRI (Electric Power Research Institute) Journal;* **8**: No. 7, 6-13(Sep 1983).

Decision makers need a way of capturing the essence of complex problems, and they are increasingly turning to the formal techniques of decision analysis to frame critical decisions, ranging from national policy to building a power plant. 4 references, 2 figures, 1 table.

## 9902 Mathematics And Computers

*REFER ALSO TO CITATION(S) 2485, 2486, 2489, 2490, 2493, 2495, 2500, 2501, 3117, 3193, 3609, 4123, 4255*

4245 (CONF-8305107—, pp 91-98) **What good is Operations Research after an emergency.** George, L.L. (Lawrence Livermore National Lab., CA). 1983. NTIS, PC A13/MF A01.

From 17. Asilomar conference on fire and blast effects of nuclear weapons; Pacific Grove, CA, USA (30 May 1983).

Operations Research is ready and waiting to help after emergencies. One reason it has been used so little is no longer applicable, the lack of computer support. I recommend that emergency managers prepare the data, the programs, the operations researchers and themselves to use the support Operations Research can provide after emergencies. 70 references.

4246 **(EUR—7900) BAESNUM, a conversational computer program for the Bayesian estimation of a parameter by a numerical method.** Colombo, A.G.; Jaarsma, R.J. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1982. 43p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83703817.

This report describes a conversational computer program which, via Bayes' theorem, numerically combines the prior distribution of a parameter with a likelihood function. Any type of prior and likelihood function can be considered. The present version of the program includes six types of prior and employs the binomial likelihood. As input the program requires the law and parameters of the prior distribution and the sample data. As output it gives the posterior distribution as a histogram. The use of the program for estimating the constant failure rate of an item is briefly described.

4247 **(EUR—7959) Characterization of the Dirichlet distribution as prior.** Colombo, A.G.; Costantini, D. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1982. 11p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83703818.

This paper presents a characterization of the Dirichlet distribution. The characterization is based on certain assumptions which are defined and discussed.

4248 **(ORNL/CSD—126) Two-level compromise designs for estimating main effects and detecting interactions.** Morris, M.D.; Mitchell, T.J. (Oak Ridge National Lab., TN (USA)). Nov 1983. Contract W-7405-ENG-26. 35p. NTIS, PC A03/MF A01. Order Number DE84002997.

This report describes a procedure for constructing experimental designs for use in estimating main effects, and detecting the presence of interactions in factorial models. D-optimality and tr(L)-optimality are the two design selection criteria used in constructing these compromise designs. A catalogue of compromise designs for $k = 4$ through 9 and $n = k + 2$ through $2k + 1$ is given in Appendix II, where k is the number of experimental factors and n is the number of experimental runs.

4249 **(SAND—83-1401C) COBOL programming standards at Sandia Labs.** Robinson, L. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 73p. (CONF-8310211—1). NTIS MF A01. Order Number DE84001790.

From USE conference; Orlando, FL, USA (4 Oct 1983).

Microfiche only, copy does not permit paper copy reproduction.

Sandia has developed an extensive set of programming standards, some of which are highlighted. These standards are designed to encourage maintainable, readable, reliable, transportable, and efficient programs. The Standards Review Committee operates as Sandia's vehicle for accommodating revisions to standards, and the methods used to implement standards include documentation, training, and structured walk-thrus.

4250 **(SAND—83-2164C) Some technical issues in geometric modeling.** Peterson, D.P. (Sandia National Labs., Albuquerque, NM (USA)). 1983. Contract AC04-76DP00789. 21p. (CONF-8311101—1). NTIS, PC A02/MF A01. Order Number DE84000942.

From 12. CAM-I annual meeting and technical conference; Dallas, TX, USA (8 Nov 1983).

Portions are illegible in microfiche products.

The full impact of CAD/CAM will not be felt until geometric modeling systems support dimensioning and tolerancing, have sophisticated user interfaces, and are capable of routinely handling many representation conversions. The attainment of these capabilities requires a joint effort among users, implementors, and theoreticians of geometric modeling.

4251 **(UCID—19919) EE/NESD computer-aided engineering FY '84 plan.** Merrill, R.D. (Lawrence Livermore National Lab., CA (USA)). Oct 1983. Contract W-7405-ENG-48. 20p. NTIS, PC A02/MF A01. Order Number DE84002145.

The NESD CAE FY84 plan is to expand facilities with a 400 MB disk storage, color graphics workstation, with graph tablet cursor control and companion copier and add a Division LSI-11/23 as a DECnet gateway node on the iCAEn etherway; expand CAE tools with TEX, DELIGHT, PICTURE, VAXIMA, a word processor, a VAX version of SOCKITTOME, and other applications, specific EE and software engineering CAE tools; and develop a CAE environment to provide the engineer with a user friendly computer interface.

4252 **(UCRL—88913) Approach to real-time holography.** Davidson, H.L.; Friedland, S.S. (Lawrence Livermore National Lab., CA (USA); Tel Aviv Univ. (Israel). Dept. of Physics). 15 Jul 1983. Contract W-7405-ENG-48. 7p. (CONF-830874—30). NTIS, PC A02/MF A01. Order Number DE84002779.

From 27. annual international technical symposium on high speed photography, videography and photonics; San Diego, CA, USA (21 Aug 1983).

Various diagnostic procedures in medicine, industry and defense produce 3-Dimensional data bases adequate to calculate a hologram. In most cases the nearer to real time the hologram can be produced the more beneficial. Since a hologram is a superposition of Fresnel zone plate patterns from each point source in the object volume on to the image plane a cellular array processor is suggested which will produce a factor of a million reduction in the time to calcuiate a hologram.

4253 **(UCRL—89894) Engineering work stations in the national laboratory.** O'Brien, D.W. (Lawrence Livermore National Lab., CA (USA)). Oct 1983. Contract W-7405-ENG-48. 3p. (CONF-831015—19). NTIS, PC A02/MF A01. Order Number DE84002459.

From Nuclear science symposium; San Francisco, CA, USA (19 Oct 1983).

The engineering workstation is characterized as a personal computer with sufficient computational capabilities and peripherals to support computer-aided engineering tools in a highly interactive way. The requirements for and significance of the engineering workstation are briefly summarized. (LEW)

4254 **(UCRL—89969) Some predictions on the performance of future supercomputers for simulation and control.** Davidson, H.L. (Lawrence Livermore National Lab., CA (USA)). 21 Oct 1983. Contract W-7405-ENG-48. 7p. (CONF-831015—18). NTIS, PC A02/MF A01. Order Number DE84002785.

From Nuclear science symposium; San Francisco, CA, USA (19 Oct 1983).

This talk will discuss what is meant by a supercomputer, some of the reasons why their performance is not as high as we would like, some techniques for improving this performance, and finally some predictions of how fast they will become in the near future, and what sorts of interesting and entertaining things we can do with these faster machines.

4255 **Numerical solution of initial/boundary-value problems in one space dimension.** White, A.B. Jr. (Los Alamos National Lab., NM). *SIAM (Society for Industrial and Applied Mathematics) Journal on Numerical Analysis;* **19**: No. 4, 683-697(Aug 1982).

The numerical solution of initial/boundary-value problems of the form A(u, x, t)u/sub t/ + B(u, x, t)u/sub x/ = c(u, x, t) is considered. Particular emphasis is placed on the solution of problems with large gradients, e.g., shocks and boundary layers. A mesh-selection technique is described that accurately places points in regions where the solution is rapidly changing. This is accomplished by a transformation of the original equations to a new coordinate system. Finite difference solutions for two sample problems are calculated.

4256 **Optimal parameters for linear second-degree stationary iterative methods.** Manteuffel, T.A. (Sandia National Labs., Albuquerque, NM). *SIAM (Society for Industrial and Applied Mathematics) Journal on Numerical Analysis;* **19**: No. 4, 833-839(Aug 1982).

In this paper we show that the optimal parameters for linear second-degree stationary iterative methods applied to nonsymmetric linear systems can be found by solving the same minimax problem used to find optimal parameters for the Chebyshev iteration. In fact, the Chebyshev iteration is asymptotically equivalent to a linear second-degree stationary method. The method of finding optimal parameters for the Chebyshev iteration given in Manteuffel [Numer. Math., 28 (1977), pp. 307-327] can be used to find optimal parameters for the stationary method as well.

4257 **Parametric integer linear programming: a synthesis of branch and bound with cutting planes.** Rountree, S.L.K. (Sandia National Labs., Albuquerque, NM); Gillett, B.E. *European Journal of Operational Research;* **10**: 183-189(1982).

A branch and bound algorithm is designed to solve the general integer linear programming problem with parametric right-hand sides. The right-hand sides have the form $b + \theta d$ where b and d are conformable vectors, d consists of nonnegative constants, and $\theta$ varies from zero to one. The method consists of first determining all possible right-hand side integer constants and appending this set of integer constants to the initial tableau to form an expanded problem with a finite number of family members. The implicit enumeration method gives a lower bound on the integer solutions. The branch and bound method is used with fathoming tests which allow one family member possibly to fathom other family members. A cutting plane option applies a finite number of cuts to each node before branching. In addition, the cutting plane method is invoked

whenever some members are feasible at a node and others are infeasible. The branching and cutting process is repeated until the entire family of problems has been solved.

4258 **Properties of estimators for the gamma distribution.** Bowman, K.O. (Union Carbide Corp., Oak Ridge, TN); Shenton, L.R. *Communications in Statistics. Part B: Simulation and Computation;* **11**: No. 4, 377-519(1982). Contract W-7405-ENG-26.

Accurate moments of maximum likelihood and moment estimators for the scale and shape parameters of a two parameter gamma density are given, the former being tabulated over a segment of the parameter space. In addition, joint acceptance regions are given for a particular case. The three parameter model is also considered and comments made on second order asymptotics for the maximum likelihood estimators.

4259 **Accuracy functions for confidence bounds: a basis for sample size determination.** Poggio, E.C. Berkeley, CA; Univ. of California (1979). 132p. University Microfilms Order No. 80-00,481.

Thesis (Ph. D.).

In many applications of statistics, a one-sided confidence bound provides the desired form of inference. In designing experiments or choosing data to be collected for such applications, there is no standard basis currently offered in the literature for determining sample sizes. This thesis attempts to provide such a basis. Suppose X is a random vector with distribution P/sub $\theta$, nu/, where $\theta$ is a real parameter and the parameter of interest and nu is a nuisance parameter. Suppose $\theta$(X) and anti $\theta$(X) are, respectively, (1-$\alpha$)-lower and -upper confidence bounds for $\theta$. The absolute accuracy functions for the lower and upper confidence bounds are defined, respectively, by P/sub $\theta$, nu/ [anti $\theta$-c$<\theta$t and P/sub $\theta$, nu/-[anti $\theta$(X) $< \theta + c$] for $c > 0$; and relative accuracy functions, by P/sub $\theta$, nu/[$\theta$-c $\theta < \theta$ (X)] for c belongs to (0,1) and $\theta > 0$ and P/sub anti $\theta$, nu/[$\theta$ (X) $< \theta + c\theta$] for $c > 0$ and $\theta > 0$. It is proposed that the size of a sample on which a confidence bound is to be computed may, in many instances, be appropriately based on the criterion that a selected accuracy function be at least of size $\beta$ where $\beta$ belongs to ($\alpha$,1). In some applications, it is possible to find a sample size satisfying the selected criterion for all possible values of $\theta$ and nu; in others, it is possible to satisfy it only for a restricted range of values. The accuracy functions are investigated in several settings. In the one- and two-sample location and scale problem, the accuracy functions are found to be constant or monotonic under natural invariance assumptions on the confidence bounds.

## 9903 Information Handling

*REFER ALSO TO CITATION(S) 3202*

4260 **(LA-UR—83-2979) Processing time using Datatrieve-11, clunks, and FORTRAN.** Horning, R.R.; Goode, W.E. (Los Alamos National Lab., NM (USA); Digital Equipment Corp., Los Alamos, NM (USA)). 1983. Contract W-7405-ENG-36. 5p. (CONF-8310182—1). NTIS MF A01. Order Number DE84001706.

From US fall DECUS symposium; Las Vegas, NV, USA (24 Oct 1983).

Microfiche only, copy does not permit paper copy reproduction.

Although Datatrieve-11 processes dates with 100-ns resolution using clunks, it has no provision for processing time. This paper describes a set of Datatrieve-11 procedures and FORTRAN-callable subroutines for handling time, as well as dates, expressed in clunks. Although the FORTRAN-callable subroutines use RMS modules, these modules can be extracted from the appropriate RMS library, allowing FORTRAN programs to be linked to an FCS library instead of to RMS.

4261 **(LA-UR—83-2980) Multidomain, multirecord-type Datatrieve-11 databases.** Horning, R.R. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 7p. (CONF-8310182—3). NTIS MF A01. Order Number DE84001707.

From US fall DECUS symposium; Las Vegas, NV, USA (24 Oct 1983).

Microfiche only, copy does not permit paper copy reproduction.

Data bases consisting of multiple domains and multirecord-type domains present special problems in design, loading, maintenance, and report generation. The logical association of records is a fundamental concern in all these problem areas. This paper describes techniques for dealing with this and other specifics using Datatrieve-11, Sort-11, FORTRAN 77, and the RSX-11M Indirect Command File Processor.

4262 **(N—8325025) Energy. A continuing bibliography with indexes, issue 36, January 1983.** (National Aeronautics and Space Administration, Washington, DC (USA)). Jan 1983. 326p. (NASA-SP—7043(36)). NTIS, PC $15.00.

This bibliography lists 1297 reports, articles, and other documents introduced into the NASA scientific and technical information system from October 1, 1982 through December 31, 1982.

4263 **(PNL-SA—11539) Research topics in statistical database management.** Denning, D.; Nicholson, W.; Sande, B.; Shoshani, A. (SRI International, Menlo Park, CA (USA); Pacific Northwest Lab., Richland, WA (USA); Statistics Canada, Ottawa, Ontario; Lawrence Berkeley Lab., CA (USA)). Sep 1983. Contract AC06-76RL01830. 11p. (CONF-830950—3). NTIS, PC A02/MF A01. Order Number DE84002581.

From 2. international statistical database management workshop; Los Altos, CA, USA (27 Sep 1983).

Portions are illegible in microfiche products.

This report identifies research topics in statistical database management. These topics are grouped into four major areas: characteristics of statistical databases, functionality/usage, metadata, and logical models.

4264 **Toxicology data bank steps up efforts.** Seltzer, R. (C and EN, Washington). *Chemical and Engineering News;* **60**: 33-35(18 Oct 1982).

The National Library of Medicine (NLM) of the National Institutes of Health has gathered large amounts of data on known and potential toxicants in a central repository in an accessible and conveniently usable form. The result--now covering 3030 chemicals, with another 1030 being processed for inclusion--is the Toxicology Data Bank (TDB). A data base of 5000 to 6000 chemicals is envisioned eventually. TDB is a user-oriented, on-line, interactive computer-based data file and is the only peer-reviewed public data base giving general toxicology information on chemicals. The data are compiled at Oak Ridge National Laboratory. (JMT)

## 9904 Law

4265 **(INIS-mf—8604) Radiation Protection and Control Act 1982. No. 49 of 1982.** (State of South Australia). 29 Apr 1982. 23p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704415.

This Act provides for radiation protection in the State of South Australia. It controls activities related to radioactive substances and irradiating apparatus and lays down a licensing system to this effect. The South Australia Health Commission is responsible for administering the Act and is advised by the Radiation Protection Committee created for this purpose. The powers and duties of both bodies are set out in detail. (NEA).

4266 **(INIS-mf—8607) Radiation Safety Act 1975 - No. 44 of 1975.** (Western Australia). 18 Sep 1975. 46p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704416.

This Act regulates the use of radioactive substances and irradiating apparatus, including particle accelerators as well as certain specified electronic products. The Act lays down a licensing and registration system for such substances and apparatus; it sets up a Radiological Council to administer the Act and to advise the Minister responsible for public health on matters of radiation safety. The

radioactive Substances Act 1954 and the Amending Acts of 1960 and 1964 are repealed. (NEA).

4267 **(INIS-mf—8610) Radiation (Safety Control) Ordinance 1978.** (Northern Territory of Australia). 23 Aug 1978. 41p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704418.

This Ordinance provides for the control, regulation, possession, use and transport of radioactive substance and irradiating apparatus. The Director of Health is responsible for administration of the Ordinance, which contains detailed provisions concerning the terms and conditions of licences, duties of licensees, medical examinations, maximum radiation doses, precautions to be taken to avoid exceeding such doses. The Ordinance also lays down a system of record-keeping and registration as well as packaging specifications for the transport of radioactive substances. (NEA).

4268 **(INIS-mf—8612) Order No. 571 of 7 December 1981 on apparatus used for X-ray analysis.** (Denmark). 18 Dec 1981. 18p. (In Danish). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704419.

Published in the Danish Official Gazette Part A No. 87.

This Order was made under Order No. 56 of 17 February 1977 on the use of X-ray installations etc., which prescribes that safety measures must be taken to ensure radiation protection on the basis of the recommendations of the International Commission on Radiological Protection (ICRP). The Order also implements at national level the Directive of the Council of the European Communities of 15 July 1980 amending the previous Directives laying down basic safety standards for protection against ionizing radiation. This Order came into force on 1 January 1982. (NEA).

4269 **(INIS-mf—8614) 26183 - Royal Decree 2519/1982 of 12 August approving the Regulations on Protection Against Ionizing Radiation.** (Spain). 8 Oct 1981. 49p. (In Spanish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704420.

Published in Spanish Official Gazette No. 241.

This Royal Decree approves the Regulations on Protection against Ionizing Radiation. The purpose of the Regulations is to implement the radiation protection principles laid down in the framework Act on Nuclear Energy of 29th April 1964, as amended. They supersede all existing national rules in the same field and contain administrative and technical provisions governing nuclear and radioactive installations and activities, including the use of radiation-emitting equipment. They were made in compliance with the most recent international regulations on radiation protection and safety, in particular the Recommendations of the International Atomic Energy Agency (IAEA); the Regulations also take into account the recent Euratom Directives. (NEA).

4270 **(INIS-mf—8615) Royal Decree 1157/1982 of 30 April approving the Statute of the Nuclear Safety Council.** (Spain). 7 Jun 1982. 6p. (In Spanish). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704427.

Published in the Spanish Official Gazette (No. 135).

This Decree, made in implementation of the Act of 1980, setting up the Nuclear Safety Council, lays down the statutes, responsibilities, structure and rules of procedure of the Council as well as its staff rules. (NEA).

4271 **(INIS-mf—8621) Decree No. 524 of 8 June 1982 of the President of the Republic implementing CEC. Directive No. 77/576 for standardization of Member States' legislative, regulatory and administrative provisions on safety signs in workplaces and CEC Directive No. 79/640 amending the Annexes of the latter.** (Italy). 10 Aug 1982. 3p. (In Italian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE83704421.

Published in Italian Official Gazette No 218.

This Decree implements at national level Directive No 77/576 of 27 July 1977 of the Commission of the European Communities, as amended by Directive No 79/640 of 21 June 1979. The Directive provides for the standardization by Member States of their legislative, regulatory and administrative provisions concerning safety signs in workplaces, including radioactivity symbols. (NEA).

4272 **(INIS-mf—8624) Stb No. 501 - Decree of 24 June 1981 to amend the Radioactive Materials Decree made under the Nuclear Energy Act.** (The Netherlands). 1981. 18p. (In Dutch). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704422.

Published in the Netherlands Bulletin of Acts, Orders and Decrees.

This Decree incorporates in the Radioactive Materials Decree (Stb No. 404, 1969) certain provisions of the 1963 Ionizing Radiation (Safety) Decree as well as certain rules in the 1964 Mining Regulations concerning radioactive materials. It furthermore embodies in the national legislation the Euratom revised basic radiation protection standards of 1 June 1976, as amended on 27 March 1979. The 1963 Ionizing Radiation (Safety) Decree was repealed by Decree of 12 October 1981. (NEA).

4273 **(INIS-mf—8625) Stb No. 502 - Decree of 24 June 1981 to amend the Devices Decree made under the Nuclear Energy Act.** (The Netherlands). 1981. 14p. (In Dutch). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704423.

Published in the Bulletin of Acts, Orders and Decrees.

This Decree incorporates in the Devices Decree (Stb No 406 1969) certain provisions of the 1963 Ionizing Radiation (Safety) Decree as well as certain rules in the 1964 Mining Regulations concerning radiation emitting equipment and mining and drilling activities. It furthermore embodies in the national legislation the Euratom revised basic radiation protection standards of 1 June 1976, as amended on 27 March 1979. The 1963 Ionizing Radiation (Safety) Decree was repealed by Decree of 12 October 1981. (NEA).

4274 **(INIS-mf—8629) Act No. 2690 concerning the Turkish Atomic Energy Association.** (Turkey). 13 Jul 1982. 7p. (In Turkish). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83704429.

Published in the Turkish Official Gazette.

The purpose of this Act is to reorganise the Turkish Atomic Energy Commission (TAEC) into an Association (TAEA) in order to provide it with greater powers. While remaining under the direct supervision of the Prime Minister, the TAEA how has legal personality, with more independence and flexibility from the financial and administrative viewpoints. (NEA).

4275 **Legal regime for the nuclear electricity-generating policy in France.** Baleynaud, P. Poitiers, France; Poitiers University (1982). 1165p. (In French). University of Poitiers, France.

The purpose of this thesis is to analyse the whole of the legal regime applicable to the national nuclear electricity generating policy, also with reference to comparative law. The connection between law and a novel technique is high-lighted and on this occasion, an assessment is made concerning the texts of ordinary law which govern other energies with a view to finding out whether they are adequate or whether legislation and regulations specific to the nuclear field have to be established. This approach to the nuclear problem is all the more interesting since the siting of power plants gives rise to reservations and opposition by the population and that the atom is at the heart of present concerns in connection with environmental protection.

4276 **Thirty-first to thirty-third annual report on the work of the Institut fuer Voelkerrecht at the Universitaet Goettingen. 1 April 1979 to 31 December 1981.** Goettingen, Germany, F.R.; Goettingen Universitaet ([nd]). 68p. (In German). Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe (Germany, F.R.).

The four departments of the Institute are the following: (1) Basic international law, (2) International commercial law, (3) Law of the European Community, (4) Atom energy law. Among others, they are also concerned with international environmental protection laws. The basis of the multi-facet research that is supported by the atomic energy law division is the collection of all atomic energy law documents, which were compiled in 1955 and are continuously updated. Questions of international law concerning nuclear weapons, or the problems created by the disposal of radioactive wastes

fall under this heading also. The annual reports include subjects that were discussed at seminars held during the 1979 Sommer semester, in dissertations, and in publications by the Institute and its W-workers. The reports also include a list of scientific co-operative projects. (orig./HSCH).

## 9905 Civilian Defense

4277 **(ORNL—5957) Hazard-mitigation potential of earth-sheltered residences. Final report, 1982-1983.** Chester, C.V.; Shapira, H.B.; Cristy, G.A.; Schweitzer, M.; Carnes, S.A.; Torri-Safdi, D. (Oak Ridge National Lab., TN (USA)). Nov 1983. Contract W-7405-ENG-26. 218p. NTIS, PC A10/MF A01. Order Number DE84002979.

Portions are illegible in microfiche products. Original copy available until stock is exhausted.

This report contains a review of the literature on earth-sheltered housing (ESH), an analysis of the protection potention against natural and technological hazards, cost comparison with conventional construction, and example design, and a discussion of institutional issues and policy options affecting the adoption of ESH. 70 references, 12 figures, 11 tables.

# CORPORATE AUTHOR INDEX

In the Corporate Index, report literature is indexed using the name of the organization or institution responsible for issuing the report. Headings are provided for all report literature and for published literature for which a corporate approach is especially desirable, e.g., symposium and conference proceedings.

Each entry under a corporate heading gives the document title and the volume and abstract numbers. The document type, e.g., R for Report; country of publication, e.g., US; and language of the document, e.g., In German; are given in parentheses at the end of the entry. If no language statement appears, the language is English. Tables of document types and country of publication codes appear after the indexes.

DOE Energy Information Data Base: Corporate Author Entries (DOE/TIC-4585) is used in the standardization of corporate entries. DOE/TIC-4585 is available for purchase from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, Virginia 22161.

Methods of economic analysis applied to fusion research. Final report, 9:4155 (R;US)

**Ecoview, Napa, CA (USA)**
Direct-heat applications of geothermal energy in The Geysers/Clear Lake region. Volume II. Environmental assessment. Final report, 9:2168 (R;US)

**EG and G Idaho, Inc., Idaho Falls (USA)**
Alcohol-Fuel-Technology Grant Program: an evaluation and summary, 9:2089 (R;US)
Analysis of results from a loss-of-offsite-power-initiated ATWS experiment in the LOFT facility, 9:2411 (R;US)
Catalytic distillation: a government-industry success story, 9:2649 (R;US)
Comparisons of the SCDAP computer code with bundle data under severe accident conditions, 9:2410 (R;US)
Description and operation of Haakon School geothermal-heating system, 9:2180 (R;US)
Economics of low-level radioactive waste disposal, 9:1950 (R;US)
Evaluation of direct-use-project drilling costs, 9:2171 (R;US)
Experiment analysis and summary report for LOFT ATWS experiments L9-3 and L9-4, 9:2445 (R;US)
Feasibility study on feed and bleed for pressurized-water reactors, 9:2409 (R;US)
Final report on PE-II activities from August 1981-September 1983, 9:4158 (R;US)
Interim results of the accident sequence evaluation program (ASEP), 9:2457 (R;US)
One-dimensional nodal neutronics routines for the TRAC-BD1 thermal-hydraulics program, 9:2412 (R;US)
Pumps-as-turbines experience profile, 9:2192 (R;US)
Raft River 5MW(e) binary geothermal-electric power plant: operation and performance, 9:2169 (R;US)
Results and analysis of a loss-of-feedwater induced ATWS experiment in the LOFT facility, 9:2408 (R;US)
Selecting host states for low-level waste-disposal sites, 9:1949 (R;US)
Severe fuel-damage scoping test performance, 9:2405 (R;US)

**Eidgenoessische Technische Hochschule, Zurich (Switzerland). Lab. fuer Festkoerperphysik**
Superconducting ground state of a strongly interacting electron system: $UBe_{13}$, 9:2711 (R;US)

**Elektrisitetsforsyningens Forskningsinstitutt, Trondheim-NTH (Norway)**
Digital substation control systems in the electricity supply. System description, 9:2197 (R;NO;In Norwegian)
New, renewable energy sources in the Norwegian energy production system. Summary report, 9:2576 (R;NO;In Norwegian)

**Emmanuel Coll., Boston, MA (USA)**
Geomagnetic pulsations-production/interpretation. Final scientific report 1 Sep 78-30 Sep 81, 9:3503 (R;US)

**Energotechnology Corp., Cambridge, MA (USA)**
Reclaiming lost capability in power plant coal conversions: an innovative, low-cost approach, 9:2190 (R;US)

**Energy Management Centre, New York (USA)**
Selection of an energy R and D portfolio for the European Community. Part II. A data handbook of probability assessments for energy technologies, 9:4241 (R;XE)

**Ente Nazionale per l'Energia Elettrica, Pisa (Italy). National Geothermal Unit**
Community demonstration project: geothermal pair of wells at Latera. Final drilling report, 9:2163 (R;XE;In English and Italian)
Community demonstration project: geothermal wells at Cesano. Final drilling report, 9:2164 (R;XE;In English and Italian)

**Environmental and Chemical Sciences, Inc., Aiken, SC (USA)**
Preliminary biological measurement program in the Savannah River. Final report, 1 March-31 August 1982. Volume II, 9:3342 (R;US)

**Environmental Protection Agency, Ann Arbor, MI (USA)**
Derivation of I/M benefits for pre-1981 light duty vehicles for low altitude, non-California areas, 9:2675 (R;US)

**Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Monitoring and Systems Lab.**
Summary of the 1981 EPA (Environmental Protection Agency) national performance audit program on source measurements. Final report, 9:3281 (R;US)

**Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Sciences Research Lab.**
Source apportionment methods applied to the determination of the origin of ambient aerosols that affect visibility in forested areas, 9:3271 (R;US)

**Environmental Protection Agency, Research Triangle Park, NC (USA). Industrial Environmental Research Lab.**
Computer economics of physical coal cleaning and flue gas desulfurization, 9:1804 (R;US)
Environmental monitoring reference manual for synthetic fuels facilities. Users manual Sep 82-May 83, 9:1805 (R;US)

**Erevanskij Fizicheskij Inst. (USSR)**
Discrete symmetries in SO(N) grand unified groups and the survival hypothesis, 9:3795 (R;SU)
Fine structure in the orientational dependence of the total yield of superfast electrons from a diamond crystal, 9:2822 (R;SU;In Russian)
Inclusive spectra of hadrons in photon-nucleus collisions, 9:3742 (R;SU)
Origin of low energy antiprotons in cosmic rays, 9:3449 (R;SU)
Phenomenon of the minimum of radiation energy losses of relativistic electrons in the crystal, 9:3965 (R;SU;In Russian)
Reggeon field theory at $D = 2$ in two-loop approximation, 9:3744 (R;SU)
Renormalizability of reggeon field theory with account of thresholds and mass terms at $D = 2$, 9:3743 (R;SU)

**Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.). Naturwissenschaftliche Fakultaet 1 - Mathematik und Physik**
Investigation of lattice defects in zinc after proton and electron irradiation, 9:2705 (R;DE;In German)
Spectroscopy of the neutrons from the decay of the giant quadrupole resonance region in $^{208}$Pb, 9:3927 (R;DE;In German)

**Exide Management and Technology Co., Yardley, PA (USA)**
Report for 1981 on research, development and demonstration of nickel-zinc batteries for electric vehicle propulsion, 9:2528 (R;US)

**Exxon Nuclear Co., Inc., Richland, WA (USA)**
Extended Burnup Demonstration Reactor Fuel Program: development of an intrinsic germanium detector gamma-scan system, 9:2201 (R;US)

**Exxon Research and Engineering Co., Linden, NJ (USA). Corporate Research Science Lab.**
Electron-electron interactions and broken symmetry in one dimension, 9:3541 (R;US)

## F

**Florida Atlantic Univ., Boca Raton (USA). Center for Energy Conservation**
Maximally cost-effective residential retrofit demonstration program. Residential Conservation Demonstration Program. Final report, 9:2624 (R;US)

**Florida Public Service Commission, Tallahassee (USA)**
Residential conservation demonstration program. Final report, 9:2622 (R;US)

**Florida State Univ., Tallahassee (USA). Dept. of Physics**
Studies of spin excitations with electromagnetic and hadronic probes, 9:3904 (R;US)

**FluiDyne Engineering Corp., Minneapolis, MN (USA)**
MHD air heater technology development. Technical progress report, October 1, 1982-September 30, 1983, 9:2579 (R;US)

**Fluor Engineers and Constructors, Inc., Irvine, CA (USA)**
Assessment of discharges from Sasol I Lurgi-based coal gasification plant. Final report Sep 81-Mar 82, 9:1806 (R;US)
**Foersvarets Forskningsanstalt, Umea (Sweden)**
Effect of cadmium on transmitter transportation, 9:3411 (R;SE;In Swedish)
**Food and Agriculture Organization of the United Nations, Rome (Italy)**
Isotope and radiation applications to agricultural development in Asia and the Pacific Region. Speech given during the seminar, 9:3389 (R;MY)
**Forest Products Lab., Madison, WI (USA)**
Survey completion report: residential fuelwood use in the United States: 1980-81, 9:2093 (R;US)
**Forsvarets Forskningsinstitutt, Kjeller (Norway)**
Charcoal as an alternative energy carrier. Pt. 4: Systems studies, 9:2077 (R;NO;In Norwegian)
Charcoal as an alternative energy carrier. Pt. 5: Systems studies in the region of Elverum (Norway), 9:2094 (R;NO;In Norwegian)
Charcoal as an alternative energy carrier. Pt.2: Conversion of biomass, 9:2078 (R;NO;In Norwegian)
Charcoal as an alternative energy carrier. Pt.3: Preparation and use of charcoal and by-products, 9:2079 (R;NO;In Norwegian)
Charcoal as an alternative energy carrier. Pt.1: Resources, 9:2111 (R;NO;In Norwegian)
Charcoal based $CO_2$-generator for use in greenhouses, 9:2650 (R;NO;In Norwegian)
Charcoal for warming and $CO_2$-supply in greenhouses - possible use, 9:2651 (R;NO;In Norwegian)
Charcoal for warming and $CO_2$-supply in greenhouses - some economical comments, 9:2652 (R;NO;In Norwegian)
$CO_2$- budget in greenhouses with $CO_2$- addition, 9:3266 (R;NO;In Norwegian)
Pyrolysis tests with Cornell retort in production of charcoal, 9:2095 (R;NO;In Norwegian)
**Framatome, 92 - Paris La Defense (France)**
Analysis of results from a loss-of-offsite-power-initiated ATWS experiment in the LOFT facility, 9:2411 (R;US)
**Freie Univ. Berlin (Germany, F.R.). Fachbereich Physik**
Experimental investigations on the dynamics and energetics of excess electrons in liquid and gaseous ethane and in liquid tetramethylsilane, 9:3031 (R;DE;In German)

## G

**Garrett Turbine Engine Co., Phoenix, AZ (USA)**
Advanced Gas Turbine (AGT) powertrain system development for automotive applications, 9:2667 (R;US)
**Gas Processors Association, Tulsa, OK (USA)**
Vapor liquid equilibrium study of the $H_2S$-$CH_4$ system at low temperatures and elevated pressures. Research report (annual) Jan-Dec 79, 9:2083 (R;US)
**GA Technologies, Inc., San Diego, CA (USA)**
Fuel performance models for high-temperature gas-cooled reactor core design, 9:2245 (R;US)
TRISO-coated HTGR fuel pressure-vessel performance models, 9:2244 (R;US)
Tubing for augmented heat transfer, 9:2653 (R;US)
**General Accounting Office, Washington, DC (USA). International Div.**
Information on the operation of the International Energy Agency's Coal Industry Advisory Board, 9:2561 (R;US)
**General Accounting Office, Washington, DC (USA). Office of the Comptroller General**
Issues facing the future use of Alaskan NorthSlope natural gas, 9:1898 (R;US)

Safety and health in underground mine waste disposal. Open file report Oct 81-Dec 82, 9:1799 (R;US)
**Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii**
Calculation of temperature fields in the pulsed fusion reactor blanket elements, 9:4162 (R;SU;In Russian)
Distributions of accelerated ion ranges. Helium and lithium isotopes, 9:3967 (R;SU;In Russian)
Dynamics of radiation-induced point defects in metals, 9:2692 (R;SU;In Russian)
Evolution of spontaneous magnetic fields in an expanding laser-produced plasma, 9:4163 (R;SU;In Russian)
Program complex for computation of the two-dimensional plasma distribution function in the OGRA-4 magnetic trap, 9:4058 (R;SU;In Russian)

Thermalization of neutrons in a heterogeneous cell of the molten salt reactor core, 9:2325 (R;SU;In Russian)
To the theory of non-adiabatic transitions between degenerated states, 9:4007 (R;SU;In Russian)
Transport factors due to the dissipative ballooning models, 9:4059 (R;SU;In Russian)

**Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki**
Generalized internal long wave equations: construction, hamiltonian structure and conservation laws, 9:4018 (R;SU)
Pionino: an argument against massless gluino, 9:3839 (R;SU)
Possible mechanism of cosmological term cancellation, 9:3450 (R;SU)
Search for events having six quarks in the final state, 9:3633 (R;SU;In Russian)
Stability regions of one-dimensional solitons of a charged scalar field, 9:3838 (R;SU;In Russian)

**Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.**
Application of polynomial expansions for calculating neutron transport through spherical regions with cavities, 9:2324 (R;SU;In Russian)
Averaging of constants in the $B^2$ approximation for reactor calculation, 9:2323 (R;SU;In Russian)
Construction of Green functions by the additive operator splitting method, 9:4006 (R;SU;In Russian)
Investigation of neutron kinetics in the nanosecond range in a depleted uranium sphere, 9:3966 (R;SU;In Russian)
Measuring background by the DIN-1M spectrometer using the oscillating absorbing screen method, 9:3173 (R;SU;In Russian)
Method for calculating the temperature field in the fast reactor fuel assembly with random distribution of parameters by the Monte Carlo method, 9:2260 (R;SU;In Russian)
Method for determining the mass of stagnant liquid during an infinite rod fuel assembly flowing round, 9:2333 (R;SU;In Russian)
Technique for calculating stationary and dynamic regimes in a nuclear power plant coolant circuit with coolant boiling, 9:2204 (R;SU;In Russian)

**Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij**
Eigenvalue problem in the QCD simulating theory, 9:3757 (R;SU)
Energy and quantum number fluxes in $K^+p$ and $\pi^+p$ interactions at 32 and 70 GeV/c, 9:3629 (R;SU;In Russian)
Energy dependence of spin-spin correlation parameters in large-angle pp scattering, 9:3758 (R;SU;In Russian)
Hadronic heavy flavour production from the $2 \rightarrow 3$ QCD subprocess, 9:3760 (R;SU)
Heisenberg operators of generalized Toda lattice, 9:4008 (R;SU)
Liouville supersymmetrical equation for a quantum case, 9:4009 (R;SU;In Russian)
One method to calculate of color factors of Feynman diagrams, 9:3812 (R;SU;In Russian)
Properties of scalar constituents of hadrons with respect to SU(2)sub(L)xU(1) group, 9:3813 (R;SU)
Quantum theory of two-dimensional generalized Toda lattice on bounded spatial interval, 9:3834 (R;SU)
Some new results in classical theory of relativistic string, 9:3759 (R;SU)
Two-dimensional exactly and completely integrable dynamic systems (Monopoles, instantons, dual models, relativistic strings, Lund-Regge model, generalized Toda lattice, etc), 9:4037 (R;SU)

**Graz Univ. (Austria)**
Progress report 1981/82, 9:3861 (R;AT;In German)

**Grenoble-1 Univ., 38 (France)**
Contribution to the study of the thermal interaction between uranium oxide and sodium, 9:2283 (R;FR;In French)

**Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires**
Weak nucleon-nucleon interaction in few body systems, 9:3867 (R;FR)

**Grumman Aerospace Corp., Bethpage, NY (USA)**
High temperature active heat exchanger research for latent heat storage, 9:2520 (R;US)

**Grumman Aerospace Corp., Princeton, NJ (USA)**
Monte Carlo studies of tandem-mirror plasmas interacting with waves in the ion-cyclotron range of frequencies (ICRF). Annual report, October 1, 1982-September 30, 1983, 9:4048 (R;US)

# H

**Hagler, Bailly and Co., Washington, DC (USA)**
Assessment of research opportunities for advanced gas-fired systems in agriculture. Final report Feb 82-Jun 83, 9:1884 (R;US)

**Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.)**
Experimental investigations on the dynamics and energetics of excess electrons in liquid and gaseous ethane and in liquid tetramethylsilane, 9:3031 (R;DE;In German)

**Hamburg Univ. (Germany, F.R.). Fachbereich Chemie**
Development of a radioimmunoassay of tetracycline and its derivatives, 9:3360 (R;DE;In German)

**Hamburg Univ. (Germany, F.R.). Fachbereich Physik**
Study of the particle unstable S-nucleus resonances $^5$Lisup(3/2-) and $^5$Hesup(3/2-) in the reaction $\alpha+d->\alpha+p+n$ at the c.m. energy Esub(CMS)=9.3 MeV, 9:3866 (R;DE;In German)

**Hanford Engineering Development Lab., Richland, WA (USA)**
Characteristics of spent LWR fuel relevant to its storage in geologic repositories, 9:1928 (R;US)
Correlation of yield stress changes in 316 stainless steel irradiated with high-energy and fission neutrons, 9:2689 (R;US)
Design and use of nonstandard tensile specimens for irradiated materials testing, 9:3094 (R;US)
Determination of xenon in irradiated nuclear fuel using a shielded electron microprobe, 9:1933 (R;US)

Imperial County geothermal development annual meeting: summary, 9:2156 (R;US)

**Indian Inst. of Science, Bangalore. Centre for Theoretical Studies**
Fourier optics for the Maxwell field: formalism and applications, 9:4003 (R;US)
Generalized rays in first order optics: transformation properties of Gaussian Schell-model fields, 9:4004 (R;US)
Realization of first order optical systems using thin lenses, 9:4005 (R;US)

**Indian Inst. of Science, Bangalore. Dept. of Physics**
Fourier optics for the Maxwell field: formalism and applications, 9:4003 (R;US)
Generalized rays in first order optics: transformation properties of Gaussian Schell-model fields, 9:4004 (R;US)
Realization of first order optical systems using thin lenses, 9:4005 (R;US)

**Industrieanlagen-Betriebsgesellschaft m.b.H., Ottobrunn (Germany, F.R.)**
Study on the design basis accident 'aircraft impact on nuclear power plant', 9:2416 (R;DE;In German)

**Ingenjoersvetenskapsakademien, Stockholm (Sweden)**
Solid fuels technology in the 80s, 9:2097 (R;SE;In Swedish)

**Ingersoll-Rand Research, Inc., Princeton, NJ (USA)**
Evaluation of novel coal cutting concepts for reduced dust generation. Open file report 28 Sep 79-7 Jan 81, 9:1810 (R;US)

**Innsbruck Univ. (Austria)**
Progress report 1982 of the Institute of Experimental Physics of the Leopold Franzens University Innsbruck, 9:3535 (R;AT;In German)

**Institute for Advanced Study, Princeton, NJ (USA)**
Prospects for further unification, 9:3827 (R;US)

**Institute of Gas Technology, Chicago, IL (USA)**
Biogasification of Walt Disney World biomass waste blend. Annual report Jan-Dec 82, 9:2080 (R;US)
Field and laboratory support for the coproduction of gas and water program. Annual report 1 Apr 82-31 Mar 83, 9:1879 (R;US)
Kinetics of devolatilization and rapid-rate methane formation. Final report Jan 72-Mar 78, 9:1780 (R;US)
Marine biomass program: anaerobic digestion systems development and stability study. Final report 1 Feb-31 Dec 82, 9:2085 (R;US)
Theoretical investigation of selected trace elements in coal gasification plants. Final report Mar 78-Nov 79, 9:1779 (R;US)

**Institute of Geological Sciences, London (UK)**
Community demonstration project: geothermal well at Southampton. Final drilling report, 9:2173 (R;XE)

**Institutet foer Vatten- och Luftvaardsforskning, Stockholm (Sweden)**
Literature survey of the composition and of the acute effects of the exhaust gases of Diesel engines, 9:3267 (R;SE;In Swedish)

**Institut National Polytechnique, 38 - Grenoble (France)**
Contribution to the study of the thermal interaction between uranium oxide and sodium, 9:2283 (R;FR;In French)

**Instituto de Fisica Teorica, Sao Paulo (Brazil)**
Gauge hierarchy problem, 9:3833 (R;BR)

**Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)**
Model to simulate the dynamic of a PWR pressurizer using the CSMP program, 9:2242 (B;BR;In Portuguese)
Properties of an extrapolation chamber for beta radiation dosimetry. Determination of calibration factors, 9:3178 (R;BR;In Portuguese)

**Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil)**
Persistent 1.5s oscillations superimposed at a solar burst observed at two mm-wavelengths, 9:3473 (R;US)

**Instruments S.A., 94 - Ivry-sur-Seine (France)**
Apparatus for enrichment of uranium by double photoionization, 9:1922 (TG;US)

**International Atomic Energy Agency, Vienna (Austria)**
Analysis of fission products in the Windscale A.G.R. coolant using on-line $\gamma$ spectrometry, 9:2247 (R;XA)
Development on experimental VHTR instrumentation, 9:2386 (R;XA)
Isotope and radiation applications to agricultural development in Asia and the Pacific Region. Speech given during the seminar, 9:3389 (R;MY)
Measurement of moisture in nuclear coolant gases. Experience and new developments within the CEGB, 9:2248 (R;XA)
Seminar on the testing and operation of off-gas cleaning systems at nuclear facilities, Karlsruhe, Germany, F.R., 3-7 May 1982, 9:1962 (R;XA)
Split-count technique for failed fuel detection and location, 9:2246 (R;XA)

**International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee**
Peak separation from time-of-flight spectra and problems of detector efficiency determination in neutron spectroscopy, 9:3176 (R;XA)

**International Centre for Theoretical Physics, Trieste (Italy)**
Anomaly extraction from the path integral, 9:3805 (R;XA)
Approach to gauge hierarchy in the minimal SU(5) model of grand unification, 9:3807 (R;XA)
Are lepton and quark families quantized dynamical systems, 9:3748 (R;XA)
Critical analysis of the electromagnetic mass shift problem in QCD, 9:3747 (R;XA)
Density of states, Poisson's formula of summation and Walfisz's formula, 9:3751 (R;XA)
Deuteron D-wave and the non-eikonal effects in tensor asymmetries in elastic proton-deuteron scattering, 9:3746 (R;XA)
Does nature like Nambu-Goldstone bosons, 9:3810 (R;XA)
Eight-fold way to colour geometrodynamics, 9:3797 (R;XA)
Generation of baryon excess in SU/sub L/$_2$ x SU/sub R/$_2$ x SU/sub c/$_4$, 9:3801 (R;XA)
Global quantity for dyons with various charge distributions, 9:3752 (R;XA)
Hadronic couplings of open beauty states, 9:3755 (R;XA)
Instanton-anti-instanton interaction in the O(3) non-linear $\sigma$ model and an exactly soluble fermion theory, 9:3745 (R;XA)
Mass and form factor effects in spectrum and width of the semileptonic decays of charmed mesons, 9:3753 (R;XA)
Necessity of intermediate mass scales in grand unified theories with spontaneously broken CP invariance, 9:3830 (R;XA)
Neutral current weak interaction without electroweak unification, 9:3796 (R;XA)
New solution for the Schwinger model, 9:3828 (R;XA)
New vacuum structure, background strength and confinement, 9:3754 (R;XA)
Note in the msub(quark) dependence of <q-barq> from chiral perturbation theory, 9:3756 (R;XA)
Order $\alpha$Gsub($\mu$) corrections to the parity-violating electron-quark potential in the Weinberg-Salam theory: parity-violations in one-electron atoms, 9:3811 (R;XA)
Problem of the deuteron smearing corrections - 1: the conventional approach, 9:3750 (R;XA)
Quark mixing angles in the left-right symmetric model with light W/sub R/ from $K^0$-$K^0$ mixing, 9:3809 (R;XA)
Quark-lepton unification and proton decay, 9:3798 (R;XA)
Radial distribution function and second virial coefficient for interacting bosons, 9:4060 (R;XA)
Relation mr << 1 in the preon model, 9:3831 (R;XA)
Role of interaction in neutrino statistics. In memory of Bronislaw Kuchowicz, 9:3749 (R;XA)
Scalar loops and the Higgs mass in the Salam-Weinberg-Glashow model, 9:3808 (R;XA)
SO(14) unification of 3+1 families, 9:3803 (R;XA)
Spinor geometry: A genesis of extended supersymmetry, 9:4036 (R;XA)
Spin-spin asymmetries with $\nu$ and $\nu$-bar beams and polarized nucleons, 9:3800 (R;XA)
Spontaneous breaking of global B-L symmetry and matter-antimatter oscillations in grand unified theories, 9:3804 (R;XA)

SU(N)-QCD$_2$ meson equation in next-to-leading order, 9:3806 (R;XA)
Supergroup extensions: from central charges to quantization through relativistic wave equations, 9:3829 (R;XA)
Surface terms and dual formulations of gauge theories, 9:3832 (R;XA)
Tests for complete breakdown of discrete symmetry in D neutral-anti D neutral, 9:3802 (R;XA)
Witten's charge formula, 9:3799 (R;XA)

**Iowa State Univ. of Science and Technology, Ames (USA)**
Performance of tornado-type wind turbines with radial inflow supply, 9:2188 (R;US)

**Iowa Univ., Iowa City (USA). Dept. of Physics and Astronomy**
Polar cap electron DEnsities from de-1 plasma wave observations. Progress report, 9:3500 (R;US)

**Israel Atomic Energy Commission, Yavne. Soreq Nuclear Research Center**
Laser-driven shock wave studies in single and double-layered slab targets, 9:4161 (R;IL)

## J

**Japan Atomic Energy Research Inst., Tokai, Ibaraki**
Analysis of results from a loss-of-offsite-power-initiated ATWS experiment in the LOFT facility, 9:2411 (R;US)

**Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment**
Development on experimental VHTR instrumentation, 9:2386 (R;XA)
JNDC nuclear data library of fission products, 9:3915 (R;JP)
Results and analysis of a loss-of-feedwater induced ATWS experiment in the LOFT facility, 9:2408 (R;US)

**Japan Atomic Energy Research Inst., Tokyo**
APPLE-2: an improved version of APPLE code for plotting neutron and gamma ray spectra and reaction rates, 9:3182 (R;JP)
Background analysis on a detector shield system for fast neutron scattering experiments, 9:3149 (R;JP;In Japanese)
Benchmark experiment on D-T neutrons and secondary gamma rays streaming through a concrete bent duct, 9:3969 (R;JP)
Best estimate analysis of LOFT L3-6/L8-1 by RELAP4/MOD6/U4/J3, 9:2439 (R;JP)
Comparisons of energy dependent point-wise cross-section generation codes: RESEND, RESENDD, RECENT, 9:3952 (R;JP)
Data on trapping and re-emission of energetic hydrogen isotopes and helium in materials, 9:3968 (R;JP)
Development of an apparatus for testing fatigue of metals at elevated temperatures in controlled environments, 9:3099 (R;JP;In Japanese)
Improvement of core mass balance calculation in REFLA-1D/MODE1, 9:2440 (R;JP)
Layer structures of oxide scales on zircaloy-4 tube exposed to steam-hydrogen mixture at high temperatures, 9:2339 (R;JP;In Japanese)
Lithium movement and tritium (hydrogen) behaviors in $Li_2O$, $Li_2SiO_3$ and $LiAlO_2$, 9:2828 (R;JP;In Japanese)
Measurement of corrosion of mild steel in high temperature-pressure pure water under $\gamma$-irradiation, 9:2708 (R;JP;In Japanese)
Measurements of fatigue crack length at elevated temperature by D. C. electrical potential method, 9:3098 (R;JP;In Japanese)
Report on operation, utilization and technical development of research reactors and hot laboratory. April 1, 1979 to March 31, 1980, 9:2390 (R;JP;In Japanese)
SCTF Core-I test results. System pressure effects on reflooding phenomena, 9:2438 (R;JP)
Semiannual progress report on the NSRR experiments, (12). January, 1981 to June, 1981, 9:2389 (R;JP;In Japanese)
Simulated HLLW compositions for cold test of waste management development, 9:1992 (R;JP)
SONATINA-2V: a computer program for seismic analysis of the two-dimensional vertical slice HTGR core, 9:2250 (R;JP)
System design considerations on the cooling system of the experimental multi-purpose very high temperature gas cooled reactor, 9:2251 (R;JP;In Japanese)
TIMS-PGG: a code system for producing group constants in fast neutron energy region, 9:2329 (R;JP;In Japanese)

**Jeppson (Morris R.), Carmel, CA (USA)**
Microwave methods and apparatus for paving and paving maintenance. Final report on Phase I, 9:2643 (R;US)

**Jet Propulsion Lab., Pasadena, CA (USA)**
Origin of SiC impurities in silicon crystals grown from the melt in vacuums, 9:2121 (R;US)
Proceedings of the Flat-Plate Solar Array Workshop on the Science of Silicon Material Preparation, 9:2123 (R;US)

**Johannes Kepler Univ., Linz (Austria)**
Progress report 1982, 9:3859 (R;AT;In German)
Progress report 1981, 9:3860 (R;AT;In German)

**Joint Inst. for Nuclear Research, Dubna (USSR)**
Electroweak asymmetry in deep inelastic muon-nucleon scattering, 9:3635 (R;SU)

**Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods**
Effect of diaphragms on the electron beam stability in an induction linear accelerator, 9:3139 (R;SU;In Russian)
Electron beam formation in the injection point in the adgezator of the electron-ring accelerator prototype, 9:3138 (R;SU;In Russian)
Magnetic field formation at the electron ring extraction from the collective accelerator model, 9:3141 (R;SU;In Russian)
Specificities of magnetic field formation in the adgezator of a collective accelerator model, 9:3140 (R;SU;In Russian)
Study of the accuracy of particle track detection by proportional chambers using cathode information readout, 9:3188 (R;SU;In Russian)

**Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of Radiation Safety**
Neutron detection channel with a counter based on the SNM-14 corona counter, 9:3184 (R;SU;In Russian)

**Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation**
Computer code realization for a mathematical model of ionization front forming process at injection of relativistic electron beam into a gas chamber, 9:3536 (R;SU;In Russian)
Simple method of energy and emission angle determination of protons registeres in heavy liquid bubble chambers, 9:3189 (R;SU;In Russian)
Symbolic evaluation of some multidimensional integrals by the computer algebraic manipulations, 9:4019 (R;SU;In Russian)

**Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy**
Change of space-time characteristics of radiation region of secondary $\pi^-$-mesons produced in pion-nucleon interactions at 40 GeV/c on reference frame, 9:3637 (R;SU;In Russian)
Charmed baryon Λsub(c)sup(+) production by approximately 58 GeV neutrons on carbon, 9:3634 (R;SU)
Differential cross section of eta meson production on carbon by $\pi^-$ mesons at the momentum of 3.3 GeV/c, 9:3638 (R;SU;In Russian)
Experimental study of the pion-xenon collisions without particle production at 3.5 GeV/c: asymmetry in proton emission, 9:3907 (R;SU)
Multiwire proportional low-pressure chamber with a high gas gain coefficient, 9:3191 (R;SU;In Russian)
Study on the dimensions of the radiation region of secondary negative pions produced in $\pi^-$N and $\pi^-$C interactions at 40 GeV/c in different reference frames, 9:3636 (R;SU;In Russian)

**Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics**
Primitives (eigenstates) of six-quark bags with an external pion field, 9:3773 (R;SU;In Russian)
Use of the rise time discriminator for the improvement of the Ge(Li)-detector parameters, 9:3190 (R;SU;In Russian)

**Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems**
Analysis of experimental data on mesic X-ray spectra of metals and their oxides, 9:3537 (R;SU;In Russian)
Design logic and modelling of RASTR special processor for C-detector of ARES spectrometer, 9:3187 (R;SU;In Russian)
Multiparticle event selection with neutral strange particle production. The electronic system of the RISK spectrometer, 9:3185 (R;SU;In Russian)
RASTR special processor design, 9:3186 (R;SU;In Russian)
Stabilized high voltage power supply of proportional and drift chambers, 9:3183 (R;SU;In Russian)
Study on muon depolarization at magnetic phase transition in $V_2O_3$, 9:3538 (R;SU;In Russian)

Two-channel time-to-digital converter, 9:3210 (R;SU;In Russian)
**Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions**
Comparison of the ionooptical parameters of one- and two-stage accelerator systems, 9:3150 (R;SU;In Russian)
Cyclotron facility for acceleration of heavy ions to 20-120 MeV/nucleon, 9:3126 (R;SU;In Russian)
Energy dependence of GITAsub(n)/GITAsub(f) partial widths ratio of neutron emission to fission for transuranium nuclei, 9:3937 (R;SU;In Russian)
**Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics**
μ-capture in a liquid hydrogen, 9:3639 (R;SU;In Russian)
Constant of the baryon-meson strong interaction, 9:3770 (R;SU;In Russian)
Microscopic model for superconductor with normal state nuclei, 9:4000 (R;SU)
Momentum spectra of light nuclei in reactions Ad → AX at large momentum transfers, 9:3868 (R;SU)
Nonradiative excitation of the muonic atom $^{238}$U as an inverse conversion process, 9:3936 (R;SU)
Relativistic wave functions of a nucleon as a quark-diquark bound state, 9:3771 (R;SU;In Russian)
Representations of osp(1,4) in terms of three boson pairs and matrices of arbitrary even order. Description of the method, 9:4038 (R;SU)
Short-range correlations in an extended time-dependent mean-field theory, 9:3953 (R;SU)
Some specific features of coherent radiation and particle propagation in crystals, 9:2829 (R;SU;In Russian)
Two-quasiparticle strength distributions in $^{62}$Ni and $^{206}$Pb, 9:3900 (R;SU)
Vector meson spin alignment in the fusion madel, 9:3772 (R;SU;In Russian)
Vibrational states of deformed odd nuclei, 9:3923 (R;SU;In Russian)
**Joint Publications Research Service, Arlington, VA (USA)**
Prediction and identification of cosmic solar radiation flux and spectra, 9:3459 (R;US)

## K

**Kansas Univ. Center for Research, Inc., Lawrence (USA)**
An investigation of the internal and external aerodynamics of cattle trucks. Final Report, 9:2638 (R;US)
**Kennedy/Jenks Engineers, Sacramento, CA (USA)**
Applicability of ratemaking and lifeline-rate standards of PURPA, 9:2571 (R;US)
**Kernenergie-Studiengesellschaft - Studiengesellschaft zur Foerderung der Kernenergieverwertung in Schiffbau und Schuffahrt e.V., Hamburg (Germany, F.R.)**
Three Mile Island 2. The accident of March 28, 1979, as seen from the point of view of radiation protection experts, 9:2434 (R;DE;In German)
**Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Abt. Sicherheit und Strahlenschutz**
Quantifying remarks to the question of uncertainties of the 'general dose assessment fundamentals', 9:3302 (R;DE;In German)
**Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung**
Computation methods and analysis on the dynamic bahavior of power plants with high temperature gas cooled reactor, 9:2252 (R;DE;In German)
Experimental investigations of actinide release from coated fuel particles for high-temperature reactors, 9:2441 (R;DE;In German)
Neutron physical and thermohydraulic investigations on the fissile fuel production with spallation neutrons, 9:1930 (R;DE;In German)
**Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralabteilung Brennelement- und Bestrahlungstechnologie**
Neutron spectra unfolding from measured detector activations, 9:3192 (R;DE;In German)
**Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik**
Improved and consistent determination of the nuclear inventory of spent PWR fuel on the basis of cell-burnup methods using KORIGEN, 9:1938 (TG;US)
**Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Schule fuer Kerntechnik**
Auxiliary systems, 9:2226 (R;DE)
Chemical operating experience in several European pressurized water reactor plants, 9:2230 (R;DE)
Cooling systems, emergency cooling, recooling, 9:2418 (R;DE)
Core design with respect to the safety concept, 9:2436 (R;DE)
Different types of intermediate storages, 9:1942 (R;DE)
Dynamics of a nuclear power plant. Behaviour of PWR plants during malfunctions and accidents, 9:2420 (R;DE)
Dynamics of a nuclear power plant. Behaviour of PWR plants in normal and upset operation, 9:2421 (R;DE)
Experience with the storage of high active waste at WAK, 9:1946 (R;DE)
Handling and storage of high-level liquid wastes from reprocessing of spent fuel, 9:1967 (R;DE)
IAEA code and safety guides on licensing, 9:2306 (R;DE)
Inspection and maintenance plans. In-service inspections, 9:2345 (R;DE)
International regulations for radiation protection, 9:1964 (R;DE)
Introduction - types and quantitites of nuclear waste - principles of waste management, 9:1966 (R;DE)
Layout of the components: Primary system components (class I), 9:2422 (R;DE)
Licensing of nuclear power plants in Brazil, 9:2305 (R;DE)
Overview of the need of manpower supply for a nuclear programme, 9:2317 (R;DE)
Procedures for maintenance and repairs, 9:2228 (R;DE)
Pt. 1: Decommissioning of nuclear facilities. Pt. 2: Methods of decommissioning of nuclear facilities, 9:2388 (R;DE)
PWR and BWR safety systems layout, 9:2419 (R;DE)
Radioactive waste disposal in the sea and alternative methods of ultimate disposal, 9:1985 (R;DE)
Report of consultants to the IAEA on requirements for the safe transport of low hazard radioactive materials, 9:1929 (R;DE)
Safety philosophy and licensing practice in different member states of IAEA: Canada, 9:2303 (R;DE)
Safety systems of heavy water reactors and small power reactors, 9:2211 (R;DE)
Secondary systems of PWR and BWR, 9:2210 (R;DE)
Site evaluation for disposal facilities in salt, 9:1984 (R;DE)
Technical, environmental and regulatory aspects of waste management and their reflection in the IAEA programme, 9:1965 (R;DE)
Treatment of concentrated waste for storage - fixation of concentrated gaseous waste, 9:1963 (R;DE)
Treatment of concentrated waste for storage and disposal, 9:1986 (R;DE)
Treatment of Pu-containing waste by acid digestion (wet combustion), 9:1983 (R;DE)
Waste management and the nuclear fuel cycle, 9:2318 (R;DE)
Waste management at the Karlsruhe Nuclear Research Center, 9:1987 (R;DE)
Water systems, 9:2227 (R;DE)
Workshop on safety analysis reports and licensing procedures. Pt. 1 A, 9:2229 (R;DE)
**Kiel Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet**
Imperfections and phase transformations by mono-N-alkylammonium-uranium glimmers, 9:3041 (R;DE;In German)
Investigations on heavy methal complexing by humin substances in estuaries, 9:2978 (R;DE;In German)
**Knolls Atomic Power Lab., Schenectady, NY (USA)**
Assessment of the accident response of a light-water-moderated breeder-reactor system: AWBA development program, 9:2443 (R;US)
Comparison of two thorium fuel cycles for use in light water prebreeder/breeder reactor systems (AWBA Development Program), 9:2286 (R;US)
Core subchannel thermal-hydraulic analysis methods and critical heat-flux margin in a light-water breeder reactor, 9:2287 (R;US)
Local heat transfer where heated rods touch in axially flowing water, 9:2442 (R;US)

**Koeln Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet**
Radiation induced modification of polyurethane for biomedical applications, 9:3032 (R;DE;In German)
**Korea Advanced Energy Research Inst., Seoul (Republic of Korea)**
Survey of fusion reactor technology. Development of design technology for the magnet system of Tokamak fusion reactor, 9:4182 (R;KR;In Korean)
**Kraftwerk Union A.G., Erlangen (Germany, F.R.)**
Comparison of neutron transport calculations with NRC test results. Final report, 9:2328 (R;DE;In German)
**Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.**
Flow test for the full scale core mockup of the KUHFR, (1). Velocity distribution and pressure loss in the core, 9:2391 (R;JP;In Japanese)
Report of research by common utilization in Research Reactor Institute, Kyoto University, in first half of fiscal 1980, 9:2392 (R;JP;In Japanese)

## L

**Laboratoires d'Electronique et de Physique Appliquee (LEP), 94 - Limeil-Brevannes (France)**
Selection of an energy R and D portfolio for the European Community. Part II. A data handbook of probability assessments for energy technologies, 9:4241 (R;XE)
**Laenstyrelsen i Malmoehus Laen, Malmoe (Sweden)**
Emergency plans for nuclear power accidents. Danish-Swedish exercise Oct 7th 1982, 9:2437 (R;SE;In Swedish)
**Lawrence Berkeley Lab., CA (USA)**
Investigation of equivalent porous medium permeability in networks of discontinuous fractures, 9:3442 (R;US)
Performance and materials aspects of Ge:Be and Ge:Ga photoconductors for far-infrared detection, 9:3211 (R;US)
Rechargeability of the zinc electrode in alkaline electrolyte, 9:2526 (R;US)
Regulation and system interdependence: effects on the siting of California electrical energy facilities, 9:2573 (R;US)
Research topics in statistical database management, 9:4263 (R;US)
Some recent advances in uranocene chemistry, 9:2915 (R;US)
Status of the Lawrence Berkeley Laboratory and Lawrence Livermore National Laboratory free electron laser (FEL), 9:3158 (R;US)
**Lawrence Livermore National Lab., CA (USA)**
Apparatus for enrichment of uranium by double photoionization, 9:1922 (TG;US)
Apparatus for isotopic separation using a high-frequency wave and coherent radiation, 9:1923 (TG;US)
Approach to real-time holography, 9:4252 (R;US)
BAGI: a new concept for the detection and tracking of hazardous gases, 9:1887 (R;US)
Beta-dosimetry studies at LLNL, 9:3981 (R;US)
Comparisons between observational color-magnitude diagrams and synthetic cluster diagrams for young star clusters in the Magellanic Clouds, 9:3458 (R;US)
Control of gas input and background pressure in the end plug regions of the TMX-U thermal barrier experiment, 9:4198 (R;US)
Design and construction of large capacitor banks, 9:4195 (R;US)
EE/NESD computer-aided engineering FY '84 plan, 9:4251 (R;US)
Effects of site characteristics on near-source recordings of strong ground motion, 9:3438 (R;US)
Engineering work stations in the national laboratory, 9:4253 (R;US)
Environmental assessment for spill tests of $NH_3$ and $N_2O_4$ at Frenchman Flat, Nevada Test Site. Revision 1, 9:3273 (R;US)
Environmental assessment of the use of radionuclides as tracers in the enhanced recovery of oil and gas. Final report, 9:1827 (R;US)
Flywheel energy-management systems for improving the fuel economy of motor vehicles. Final report, 9:2674 (R;US)
Generation of vibrationally excited $H_3$ molecules by $H_3^+$ wall collisions, 9:3546 (R;US)
Glass produced by underground nuclear explosions, 9:3258 (R;US)
Granular flow considerations in the design of a cascade solid breeder reaction chamber, 9:4194 (R;US)
Improved solid-state laser sources. Final technical report, 2 June 1981-1 June 1982, 9:3084 (R;US)
Inexpensive solid-state trigger unit for thyratrons, 9:3108 (R;US)
Initial specifications for nuclear waste package external dimensions and materials, 9:2005 (R;US)
Investigations of the mechanical behavior of spot welded joints by means of acoustic emission analysis, 9:3103 (TG;US)
Issues in radioactivity for fusion energy: remote maintenance rating, 9:4197 (R;US)
LLNL/NWC 1980 LNG spill tests. Burro series data report: the appendices, 9:1885 (R;US)
Maximum entropy reconstruction of a volume anomaly from pulse scatter data, 9:3102 (R;US)
Mechanical property measurements on Nellis Baseline Sand and Dry CARES Sand, 9:3443 (R;US)
Neutron and gamma-ray measurements on the LANL Little Boy Comet Assembly, 9:2396 (R;US)
Numerical electromagnetics code - method of moments. User's guide supplement for NEC-3 for modeling buried wires, 9:3107 (R;US)
Numerical solution to the steady state equation of transfer in azimuthally symmetric geometries, 9:3089 (R;US)
Optimized rotary flux compressors for powering laser flashlamps, 9:4196 (R;US)

Location procedure for sound sources in reactor-technical enclosures, 9:2346 (R;DD)
Phase transitions in nuclear matter and consequences for neutron stars, 9:3955 (R;DD)

# PERSONAL AUTHOR INDEX

Authors' surnames are indexed in the form appearing in the abstracted publication; given names are reduced to initials. Each author entry gives the publication title and the citation number. The document type, e.g., R for Report; country of publication, e.g., US; and language of the document, e.g., In German; are given in parentheses at the end of the entry. If no language statement appears, the language is English. Tables of document types and country of publication codes appear after the indexes. For publications with multiple authors, an entry is provided for each author. Entries for the second and succeeding authors give references to the first author.

Because of problems involved in the mechanical preparation of this index, all accent marks are omitted. Changes in spelling introduced as a result of accent omission follow standard conventions.

## NOTICE

During the preparation of *ERA*, Volume 9, Number 2, an error was introduced that resulted in the abstract numbers on all entries in the Subject and Contract Number Indexes being six digits too low. The error arose when the initial abstract number 1751 was used instead of the correct number 1757.

I regret the inconvenience to the users of *ERA* and will eliminate the error from our file prior to preparation of the cumulative indexes.

David E. Bost
Editor

# SUBJECT INDEX

The subject index is based on the use of subject descriptors selected from a controlled thesaurus of terms (DOE/TIC-7000). Subject descriptors and qualifiers (subheadings) are selected and presented in the following format:

**SUBJECT DESCRIPTOR**
**Qualifier**
Title, (supplementary information), citation number, (R:US)

The notations in the final parentheses indicate the type of document, e.g., R for Report; the country of publication, e.g., US; and the language if other than English, e.g., In German. Tables of document types and country of publication codes appear after the indexes.

The title may be supplemented with additional words, or a phrase, if it appears additional information would be helpful. In cases for which the title contains little or no information related to the subject entry, it may be replaced entirely by the supplementary information. A qualifier is not always required, and in such cases the title will follow the unqualified subject descriptor.

The descriptors selected for use as subject terms are generally the names of specific materials, things, or processes. To the extent possible, a qualifier is selected to describe the properties of, or processses applied to, the subject term.

Index entries are selected to indicate the important ideas and concepts presented in a document, rather than words that may appear in the text. Within the available thesaurus terms, the most probable or logical place to look for typical information is selected. "See references" are included to guide users from synonymous terms or phrases to the descriptor selected as a subject heading for the concept. (e.g. Pipeline Quality Gas see HIGH BTU GAS). "See also references" are used to indicate where to find references to subject concepts that are narrower, broader, or related to a particular subject heading. To complete an exhaustive search of a given subject, all such headings should be reviewed. Copies of DOE/TIC-7000, the Subject Thesaurus, are available from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, VA 22161.

## A

**ABDOMEN**
**Computerized Tomography**
Computer tomography of abdominal tumours, 9:3360 (RA;HU;In Hungarian, English)
**ABSORBED DOSES**
*See RADIATION DOSES*
**ABSORPTION SPECTROSCOPY**
**A Codes**
Atomic-absorption programme for the Apple 2 plus computer, 9:3207 (R;ZA)
**ACCELERATORS**
*See also CYCLIC ACCELERATORS*
*HEAVY ION ACCELERATORS*
*LINEAR ACCELERATORS*
**Design**
Advanced medical accelerator design, 9:3129 (J;US)
Factors affecting the operating characteristic of the zetatron: a small neutron generator for borehole logging, 9:3124 (J;US)
**Ion Sources**
High-intensity lithium-ion source, 9:3153 (J;US)
**Radiation Protection**
Radiation safety systems at Brookhaven National Laboratory's low-energy accelerators, 9:3128 (J;US)
**ACCIDENTAL IRRADIATION**
*See RADIATION ACCIDENTS*
**ACCRETION (STARS)**
*See STAR ACCRETION*
**ACCUMULATION (RADIOECOLOGICAL)**
*See RADIOECOLOGICAL CONCENTRATION*
**ACES**
*See QUARKS*
**ACETIC ACID**
**Chemical Reactions**
Desulfurization of dibenzothiophene by nickel(0) complexes: evidence for electron transfer in oxidative additions, 9:2901 (J;US)
**ACETONITRILE**
**Adsorption**
Interaction of potassium with $\pi$-electron orbital containing molecules on Pt(111), 9:2926 (J;US)
**Desorption**
Interaction of potassium with $\pi$-electron orbital containing molecules on Pt(111), 9:2926 (J;US)
**Mass Spectra**
Interaction of potassium with $\pi$-electron orbital containing molecules on Pt(111), 9:2926 (J;US)
**ACETYLENE**
**Electron Spin Resonance**
Time-domain analysis of EPR measurements of polyacetylene and soliton diffusion, 9:2812 (J;US)
**Electronic Structure**
$^2Pi_+$–X $^2\Sigma^+$ infrared electronic transition of $C_2H$, 9:3576 (J;US)
**Infrared Spectra**
$^2Pi_+$–X $^2\Sigma^+$ infrared electronic transition of $C_2H$, 9:3576 (J;US)
**Ion Emission**
Electron correlation and hole localization in photon-stimulated ion desorption from solid $N_2$, CO, and $C_2H_2$, 9:2930 (J;US)
**Photoemission**
Electron correlation and hole localization in photon-stimulated ion desorption from solid $N_2$, CO, and $C_2H_2$, 9:2930 (J;US)
**Solitons**
Time-domain analysis of EPR measurements of polyacetylene and soliton diffusion, 9:2812 (J;US)
**Spectroscopy**
Diode laser spectrometry for monitoring acetylene on-line in a liquefaction plant, 9:2889 (R;US)
**Vibrational States**
Vibrational frequencies for silaacetylene and its silylidene and vinylidene isomers, 9:2990 (J;US)
**ACETYLENES**
*See ALKYNES*
**ACETYLSALICYLIC ACID**
**Radiosensitivity Effects**
The effect of x rays, DTPA, and aspirin on the absorption of plutonium from the gastrointestinal tract of rats, 9:3396 (J;US)
**ACID RAIN**
**Pollution Regulations**
Economic impact of acid rain legislation on Illinois, 9:2537 (R;US)
**Precursor**
Characterization of reactants, reaction mechanisms, and reaction products leading to extreme acid rain and acid aerosol conditions in southern California. Final report May 81-May 83, 9:3266 (R;US)
**ACIDS (INORGANIC)**
*See INORGANIC ACIDS*
**ACIDS (ORGANIC)**
*See ORGANIC ACIDS*

**ACOUSTIC EMISSION TESTING**
Investigations on the monitoring of structural integrity and fault location for civil engineering prestressed concrete structures by acoustic emission analysis, 9:3094 (R;AT;In German)

**ACRIDINES**
**Biological Effects**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**Dose-Response Relationships**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**Mathematical Models**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)

**ACROLEIC ACID**
*See ACRYLIC ACID*

**ACRYLAMIDE**
**Nucleate Boiling**
Nucleate boiling in drag-reducing polymer solutions, 9:3084 (J;US)

**ACRYLIC ACID**
**Nucleate Boiling**
Nucleate boiling in drag-reducing polymer solutions, 9:3084 (J;US)

**ACTINIDES**
*See also AMERICIUM*
*NEPTUNIUM*
*PLUTONIUM*
*THORIUM*
*URANIUM*
**Separation Processes**
Basic science and technology, 9:1928 (RA;US)
**Transmutation**
Actinide transmutation with a $UF_6$ reactor, 9:2026 (J;US)

**ACTINIUM 227**
**Isotope Production**
Transuranium-element processing, 9:3037 (RA;US)

**ACTINIUM 233**
**Isotope Separation**
Identification of $^{233}Ac$, 9:3935 (J;US)

**ACTIVATED SLUDGE PROCESS**
Conversion of sewage sludge by anaerobic elimination of the heterofunction, 9:2656 (R;DE;In German)

**ACTIVATION DETECTORS**
**Performance Testing**
Implementation of the active neutron coincidence collar for the verification of unirradiated PWR and BWR fuel assemblies, 9:2056 (BA;XA)
**Specifications**
Implementation of the active neutron coincidence collar for the verification of unirradiated PWR and BWR fuel assemblies, 9:2056 (BA;XA)
**Spectra Unfolding**
Neutron spectra unfolding from measured detector activations, 9:3186 (R;DE;In German)

**ACTIVITY COEFFICIENT**
*See THERMODYNAMIC ACTIVITY*

**ADAMANTANE**
**NMR Spectra**
$^{13}C$ spin diffusion of adamantane, 9:2811 (J;US)
Multiple-quantum NMR in solids, 9:2867 (J;US)

**ADENOCARCINOMAS**
*See CARCINOMAS*

**ADGEZATOR**
*See ELECTRON-RING ACCELERATORS*

**ADJOINT FLUX**
**Data Covariances**
Response to "comments on 'the effects of intracell adjoint flux heterogeneity on first-order perturbation reactivity calculations'", 9:2324 (J;US)
**Perturbation Theory**
Response to "comments on 'the effects of intracell adjoint flux heterogeneity on first-order perturbation reactivity calculations'", 9:2324 (J;US)

**ADRIATIC SEA**
**Petroleum Deposits**
Development of a recovery method for Adriatic Sea heavy oil reservoirs, 9:1818 (BA;GB)

**ADSORPTION**
**Research Programs**
Research programs in adsorption carried out in the low temperature laboratory of UFRJ (Brazil), 9:3522 (RA;BR;In Portuguese)
**Thermodynamic Model**
Structure study and the adsorption system mechanism based on 'stratified volume' model, 9:3521 (RA;BR;In Spanish)

**ADVANCED GAS COOLED GRAPHITE MODERATED RE**
*See AGR TYPE REACTORS*

**ADVANCED THERMAL REACTOR FUGEN**
*See JATR REACTOR*

**ADVERSARIES**
**Nuclear Weapons**
Preliminary nuclear terrorist effects study (Detonation in city street), 9:3250 (RA;US)

**AEROMONAS**
**Population Density**
Effect of effluent from a nitrogen fertilizer factory and a pulp mill on the distribution and abundance of Aeromonas hydrophila in Albemarle Sound, North Carolina, 9:3381 (J;US)

**AFFIRMATIVE ACTION**
**Planning**
Affirmative Action Plan, October 1983 through September 1984, 9:2535 (R;US)

**AFTERLOADING**
**Irradiation Procedures**
Localization technique applied for the combined radiation treatment of uterine cancer, 9:3370 (RA;HU;In Hungarian, English)

**AGR REACTOR (WINDSCALE)**
*See WAGR REACTOR*

**AGR TYPE REACTORS**
*See also WAGR REACTOR*
**Coolants**
Measurement of moisture in nuclear coolant gases. Experience and new developments within the CEGB, 9:2242 (R;XA)

**AGRICULTURAL RESIDUES**
*See AGRICULTURAL WASTES*

**AGRICULTURAL WASTES**
**Anaerobic Digestion**
Amount of biogas and its availability for use in Finland, 9:2108 (R;FI;In Finnish)

**AGRICULTURE**
**Coordinated Research Programs**
Isotope and radiation applications to agricultural development in Asia and the Pacific Region. Speech given during the seminar, 9:3383 (R;MY)
**Fuel Consumption**
Assessment of research opportunities for advanced gas-fired systems in agriculture. Final report Feb 82-Jun 83, 9:1878 (R;US)

**AIR**
**Radioactivation**
Activation of the major constituents of tissue and air by a fast neutron radiation therapy beam, 9:3976 (J;US)
**Sorptive Properties**
Determination of molecular orientation of monolayer adsorbates by optical second-harmonic generation, 9:2902 (J;US)

**AIR CLEANING**
**Standards**
Canadian nuclear air cleaning standards and their application in Ontario Hydro, 9:2343 (RA;XA)

**AIR CLEANING SYSTEMS**
**Performance**
Aspects of retention of airborne $^{131}I$ in light water reactors during normal operation, 9:2201 (RA;XA)
Design, operation and in-plant testing of off-gas cleaning systems at BWRs, 9:2202 (RA;XA)

**Regulatory Guides**
Need for revising US Nuclear Regulatory Commission Regulatory Guide 1.52 in light of NRC-sponsored research program results and other developments, 9:2200 (RA;XA)

**AIR CONDITIONERS**
**Energy Efficiency**
Field test measurement of energy savings from high efficiency, residential electric appliances. Residential conservation demonstration program, 9:2617 (R;US)
**Heat Recovery Equipment**
In-field test results of heat-recovery units and heat pumps for domestic water heating. Residential Conservation Demonstration Program, 9:2619 (R;US)

**AIR CONDITIONING**
**Phase Change Materials**
Thermal-energy storage in crosslinked pellets of high-density polyethylene for home heating and cooling via off-peak electric power utilization, 9:3030 (J;US)

**AIR FILTERS**
**Design**
Demister apparatus for gaseous wastes carrying radioactive aerosols, 9:1952 (RA;XA;In French)
**Leak Testing**
Trends and developments for in-situ testing of HEPA filters, 9:3112 (RA;XA)
**Testing**
Analysis of the five years in-situ control of the cleaning filters used in the nuclear installations in France, 9:2344 (RA;XA;In French)
Comparison of testing methods for particulate filters, 9:3114 (RA;XA)
Comparison of some particulate air filter testing methods used in normal and unfavourable conditions, 9:3115 (RA;XA)
Experience with a standardized method and application of the recent trends for in-situ testing of HEPA-filtration systems, 9:3116 (RA;XA)
Testing HEPA filter response to high flow velocity and overpressure, 9:3113 (RA;XA)

**AIR HEATERS**
**Performance Testing**
MHD air heater technology development. Technical progress report, October 1, 1982-September 30, 1983, 9:2573 (R;US)

**AIR POLLUTION**
**Aerosols**
Interconversion of pollutants from the gaseous to the condensed phase. Technical progress report - brief summary of recent findings, March 1, 1983-August 31, 1983, 9:3258 (R;US)
**Deposition**
Analysis of forest environmental measurements to estimate parameters of microclimate and air-pollution deposition-velocity models, 9:3259 (R;US)
**Flux Density**
Analysis of forest environmental measurements to estimate parameters of microclimate and air-pollution deposition-velocity models, 9:3259 (R;US)
**Health Hazards**
Respiratory effects of air pollutants, 9:3410 (R;SE;In Swedish)
Toxicologic effects of air pollution on reproduction. Epidemiological studies - literature review, 9:3408 (R;SE;In Swedish)

**AIR POLLUTION MONITORS**
**Calibration**
Harmonization of methods for measurements of $SO_2$. Final report, 9:3264 (R;US)
**Performance Testing**
Evaluation of developmental industrial hygiene instrumentation at the University of Minnesota-Duluth gasifier, 9:3263 (R;US)
**Remote Sensing**
Progress Report 1980-81-82, 9:3050 (R;SE)

**AIR PREHEATERS**
*See AIR HEATERS*

**AIR PURIFICATION**
*See AIR CLEANING*

**AIR SAMPLERS**
**Calibration**
Calibration of a decay-product collection and counting apparatus for the determination of exhaled thoron, 9:3198 (J;GB)
**Performance Testing**
Calibration of a decay-product collection and counting apparatus for the determination of exhaled thoron, 9:3198 (J;GB)

**AIRBORNE PARTICLES**

**ALAP**
*See RADIATION PROTECTION*

**ALASKA GAS PIPELINE**
**Charges**
Issues facing the future use of Alaskan NorthSlope natural gas, 9:1892 (R;US)

**ALBEDO-NEUTRON DOSEMETERS**
**Design**
Use of wrist albedo neutron dosimeters, 9:3195 (R;US)
**Performance Testing**
Use of wrist albedo neutron dosimeters, 9:3195 (R;US)

**ALCATOR DEVICE**
**Lower Hybrid Heating**
Study of parametric instabilities during the Alcator C lower hybrid wave heating experiments, 9:4045 (R;US)
**Neutral Atom Beam Injection**
Fully ionized and total silicon abundances in the Alcator-C tokamak, 9:4136 (J;US)
**Parametric Instabilities**
Study of parametric instabilities during the Alcator C lower hybrid wave heating experiments, 9:4045 (R;US)
**Silicon Ions**
Fully ionized and total silicon abundances in the Alcator-C tokamak, 9:4136 (J;US)

**ALCOHOL FUELS**
*Use for pure alcohols, alcohol-water mixtures, or alcohols with additives; for alcohol-gasoline mixtures, use GASOHOL.*
**Economic Impact**
Impacts of alcohol fuels on the US refining industry, 9:2641 (R;US)
**Research Programs**
Alcohol-Fuel-Technology Grant Program: an evaluation and summary, 9:2083 (R;US)

**ALCOHOLS**
*See also ETHANOL*
*METHANOL*

**Shear Properties**
Phases of insoluble monolayers: Comparison between the surface pressure-molecular area (Pi-A) diagram and shear modulus measurements, 9:2987 (J;US)

**ALFVEN WAVES**
**Cyclotron Resonance**
Conversion of compressional Alfven waves into ion cyclotron waves in inhomogeneous magnetic fields, 9:4059 (R;JP)

**ALGAE**
**Physiology**
Growth and physiology of an industrially useful macroalga (Chondrus crispus), analyzed by continuous measurement of gas exchange, 9:3378 (R;FR;In French)
**Plant Growth**
Growth and physiology of an industrially useful macroalga (Chondrus crispus), analyzed by continuous measurement of gas exchange, 9:3378 (R;FR;In French)

**ALKANES**
*See also CYCLOALKANES*
*2-2-DIMETHYLPROPANE*
*ETHANE*
*METHANE*
*PROPANE*

**Chemical Reactions**
Nickel ions affect a highly specific 1,4-dehydrogenation of hydrocarbons in the gas phase: metallacycles are not involved, 9:2965 (J;US)
**Dehydrogenation**
Nickel ions affect a highly specific 1,4-dehydrogenation of hydrocarbons in the gas phase: metallacycles are not involved, 9:2965 (J;US)

**ALKENES**
*See also BUTENES*
*CYCLOALKENES*
*ETHYLENE*
*PROPYLENE*
**Chemisorption**
Coordination chemistry of benzene, toluene, cyclohexadienes, cyclohexene, and cyclohexane on Pt(100), 9:2961 (J;US)
**Synthesis**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)

**ALKINES**
*See ALKYNES*

**ALKYLATES**
*See ALCOHOLS*

**ALKYNES**
*See also ACETYLENE*
**Hydrogenation**
Coordinately unsaturated clusters. A novel catalytic reaction, 9:2982 (J;US)
**Vibrational States**
Vibrational frequencies for silaacetylene and its silylidene and vinylidene isomers, 9:2990 (J;US)

**ALLOY-A-286**
**Physical Radiation Effects**
Fracture-mechanics behavior of neutron-irradiated Alloy A-286, 9:2685 (R;US)

**ALLOY-HD-8077**
*See NICKEL BASE ALLOYS*

**ALLOY-HT-9**
**Creep**
In-reactor creep behavior of selected ferritic alloys, 9:2279 (R;US)
**Physical Radiation Effects**
In-reactor creep behavior of selected ferritic alloys, 9:2279 (R;US)
**Radioactivation**
Issues in radioactivity for fusion energy: remote maintenance rating, 9:4191 (R;US)

**ALLOY-MA-754**
*See NICKEL BASE ALLOYS*

**ALLOY-MA-956**
*See IRON BASE ALLOYS*

**ALLOYS**

**Carburization**
Materials selection for advanced-HTGR component development, 9:2250 (J;US)
**Corrosion**
Materials evaluation at the H-Coal Pilot Plant, 9:1755 (R;US)
**Corrosion Fatigue**
Materials selection for advanced-HTGR component development, 9:2250 (J;US)
**Flow Stress**
A form of Hall-Petch law for the strength of glassy metals, 9:2764 (J;DD)
**Microstructure**
A form of Hall-Petch law for the strength of glassy metals, 9:2764 (J;DD)
**Physical Radiation Effects**
Use of the disk bend test to assess irradiation performance of structural alloys, 9:2682 (R;US)
**Welded Joints**
Materials evaluation at the H-Coal Pilot Plant, 9:1755 (R;US)

**ALLOY-WAZ-16**
*See NICKEL BASE ALLOYS*

**ALLYL RADICALS**
**Structural Chemical Analysis**
Theoretical study of the allyl radical: structure and vibrational analysis, 9:2984 (J;US)
**Vibrational States**
Theoretical study of the allyl radical: structure and vibrational analysis, 9:2984 (J;US)

**ALPHA PARTICLES**
*Emitted by nuclei.*
**Charged-Particle Transport**
Transport and energy deposition of alpha particles. Fokker-PLanck equation treatment, 9:4141 (R;FR;In French)
**Energy Losses**
Transport and energy deposition of alpha particles. Fokker-PLanck equation treatment, 9:4141 (R;FR;In French)

**ALPHA REACTIONS**
**Breakup Reactions**
Study of the particle unstable S-nucleus resonances $^{5}$Lisup(3/2-) and $^{5}$Hesup(3/2-) in the reaction α+d->α+p+n at the c.m. energy Esub(CMS)=9.3 MeV, 9:3860 (R;DE;In German)
**Compound-Nucleus Reactions**
Level structure of $^{67}$Ge and its implications for the general structure of nuclei in the 1f-2p shell, 9:3890 (J;US)
**Cross Sections**
Cross sections of nuclear reactions induced by protons, deuterons, and alpha particles. Pt.8 Chlorine, 9:3884 (R;FR;In French)
**Knock-Out Reactions**
Spectroscopy of the neutrons from the decay of the giant quadrupole resonance region in $^{208}$Pb, 9:3921 (R;DE;In German)
**Quasi-Elastic Scattering**
Momentum spectra of light nuclei in reactions Ad → AX at large momentum transfers, 9:3862 (R;SU)
**Spallation**
Projectile fragmentation and light particle emission from 70 MeV/nucleon α particles on $^{197}$Au, 9:3919 (R;FR)

**ALPHA-BEARING WASTES**
**Certification**
The certification program of transuranic wastes at INEL, 9:2032 (J;US)
**Geochemistry**
Some chemical issues involved in the management and disposal of TRU wastes, 9:2029 (J;US)
**Radioactive Waste Processing**
Solidification of alpha-bearing wastes in ceramic, 9:1948 (R;XE;In German)

**ALTERNATE FUELS**
*See FUEL SUBSTITUTION*

**ALUMINIA**
*See ALUMINIUM OXIDES*

**ALUMINIUM**
**Charged-Particle Transport**
Distributions of accelerated ion ranges. Helium and lithium isotopes, 9:3961 (R;SU;In Russian)
**Crystal Structure**
Multilayer relaxation of interlayer registry and spacing at high-index metal surfaces, 9:2712 (J;US)

**Dispersions**
Local field effects in the absorbed monoshell reflectance on substrates with spatial dispersion, 9:2696 (RA;BR;In Spanish)
**Ecological Concentration**
Trace element concentrations in different trophic levels near the site of a future coal-fired power plant and related facilities, 9:3282 (RA;US)
**Electric Conductivity**
Oxidation effects on the electric resistance of In and Al in thin layers, 9:2693 (RA;BR;In Spanish)
**Leaching**
Factors affecting the preparation of misted clay feed and solids-liquid separation after HC leaching. Report of investigations, 9:3285 (R;US)
**Photoelectron Spectroscopy**
Basic assumptions and recent developments in quantitative XPS, 9:2905 (J;GB)
**Photon Transport**
Calculation of stray dose distributions of gamma and X radiation in homogeneous and inhomogeneous media by means of Monte-Carlo methods, 9:3972 (B;DE;In German)
**Physical Radiation Effects**
Defect production rates in ion-irradiated metals, 9:4174 (RA;JP;In Japanese)
**Quantity Ratio**
Analysis of the Al-Ag thin film system by Rutherford Backscattering Spectroscopy (RBS) and Auger Electron Spectroscopy (AES), 9:2695 (RA;BR;In Spanish)
**Radioactivation**
Issues in radioactivity for fusion energy: remote maintenance rating, 9:4191 (R;US)

**ALUMINIUM 26**
**Nucleosynthesis**
Nucleosynthesis of $^{26}Al$ at low stellar temperatures, 9:3484 (J;US)

**ALUMINIUM 27 TARGET**
**Carbon 12 Reactions**
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
**Iron 56 Reactions**
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
**Oxygen 16 Reactions**
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
**Oxygen 18 Reactions**
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)

**ALUMINIUM ALLOYS**
*See also ALUMINIUM BASE ALLOYS*
**Deformation**
Metal surface deformation and subsurface defect structure: a microscopy correlation study, 9:2761 (BA;US)
**Electron Diffraction**
Determination of symmetry changes in ordered alloys by convergent beam electron diffraction (Ni-Al-Ta; Ni-Al-Mo), 9:2748 (BA;US)
**Oxidation**
Gaseous reduction of an alloy oxide, 9:2969 (J;GB)
**Phase Studies**
Example of the use of combined techniques of analytical transmission electron microscopy for phase identification (Ti-8Al-4Y), 9:2749 (BA;US)
**Phase Transformations**
Diffusion decay of binary precipitation in "transitional" asymptotic range, 9:2703 (R;SU;In Russian)
**Physical Radiation Effects**
The role of environmental conditions in in-situ experiments in the high-voltage electron microscope, 9:3219 (J;DD)
**Surface Properties**
Metal surface deformation and subsurface defect structure: a microscopy correlation study, 9:2761 (BA;US)
**Thermal Expansion**
The thermal expansion of the directionally solidified Al-$CuAl_2$ eutectic, 9:2753 (J;NL)

**ALUMINIUM ARSENIDES**
**Chemical Bonds**
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
**Crystal Structure**
Structural properties of III-V zinc-blende semiconductors under pressure, 9:2848 (J;US)
**Crystal-Phase Transformations**
Structural properties of III-V zinc-blende semiconductors under pressure, 9:2848 (J;US)
**Lattice Parameters**
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)

**ALUMINIUM BASE ALLOYS**
**Stress Corrosion**
Stress corrosion testing of 5083 aluminum, 9:2751 (J;US)

**ALUMINIUM BROMIDES**
**Raman Spectra**
Raman spectra, ab initio molecular orbital calculations, vibrational analysis, and thermodynamic functions for $NH_3$:$AlX_3$ (X = F, Cl, Br), 9:3590 (J;US)
**Thermodynamic Properties**
Raman spectra, ab initio molecular orbital calculations, vibrational analysis, and thermodynamic functions for $NH_3$:$AlX_3$ (X = F, Cl, Br), 9:3590 (J;US)

**ALUMINIUM CHLORIDES**
**Raman Spectra**
Raman spectra, ab initio molecular orbital calculations, vibrational analysis, and thermodynamic functions for $NH_3$:$AlX_3$ (X = F, Cl, Br), 9:3590 (J;US)
**Thermodynamic Properties**
Raman spectra, ab initio molecular orbital calculations, vibrational analysis, and thermodynamic functions for $NH_3$:$AlX_3$ (X = F, Cl, Br), 9:3590 (J;US)

**ALUMINIUM COMPOUNDS**
*See also ALUMINIUM ARSENIDES*
*ALUMINIUM BROMIDES*
*ALUMINIUM CHLORIDES*
*ALUMINIUM HYDRIDES*
*ALUMINIUM OXIDES*
*ALUMINIUM PHOSPHIDES*
**Chemical Bonds**
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
**Lattice Parameters**
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)

**ALUMINIUM HYDRIDES**
**Catalytic Effects**
Desulfurization with transition metal catalysts, 9:1758 (R;US)
**Chemical Reactions**
Desulfurization of dibenzothiophene by nickel(0) complexes: evidence for electron transfer in oxidative additions, 9:2901 (J;US)

**ALUMINIUM OXIDES**
**Calcination**
Supported transition metal compounds. I. A new method for the preparation of alumina-supported iridium and osmium carbonyls, 9:2918 (J;US)
**Catalytic Effects**
Studies of poisoned catalysts by means of Auger electron spectroscopy and x-ray photoelectron spectroscopy (Catalytic gas detectors), 9:1899 (BA;GB)
**Chemical Preparation**
Supported transition metal compounds. I. A new method for the preparation of alumina-supported iridium and osmium carbonyls, 9:2918 (J;US)
**Deactivation**
Studies of poisoned catalysts by means of Auger electron spectroscopy and x-ray photoelectron spectroscopy (Catalytic gas detectors), 9:1899 (BA;GB)
**Dielectric Properties**
Low-temperature dielectric constant of near-stoichiometric Na $\beta$-alumina, 9:2803 (J;US)
**Evaporation**
Investigation of the evaporation thermodynamics and stationary states (so-called "congruent states") in the study of

oxides and their mixtures by the effusion method--application to $Al_2O_3$, CaO, and the mixtures $Al_2O_3$-CaO and $Ti_2O_3$-$TiO_2$, 9:2792 (J;US)

**Reduction**
Gaseous reduction of an alloy oxide, 9:2969 (J;GB)

**Thermal Diffusivity**
Thermal diffusivities of molybdenum/alumina cermets, 9:2794 (J;US)

**ALUMINIUM PHOSPHIDES**

**Chemical Bonds**
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)

**Crystal Structure**
Structural properties of III-V zinc-blende semiconductors under pressure, 9:2848 (J;US)

**Crystal-Phase Transformations**
Structural properties of III-V zinc-blende semiconductors under pressure, 9:2848 (J;US)

**Heterojunctions**
GaP/Al/sub x/Ga/sub 1-x/P heterojunction transistors for high-temperature electronic applications, 9:3104 (J;US)

**Lattice Parameters**
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)

**ALUMINUM**

**ALVEOLI (PULMONARY)**
*See LUNGS*

**AMERICIUM**

**Radionuclide Migration**
The relative mobility of natural (Th, Pb and Po) and fallout (Pu, Am, Cs) radionuclides in the coastal marine environment: results from model ecosystems (MERL) and Narragansett Bay, 9:3334 (J;GB)

**Recovery**
Chemistry research and development. Annual progress report, October 1, 1981-September 30, 1982, 9:1930 (R;US)

**AMERICIUM 241**

**Inhalation**
Inhalation carcinogenesis of high fired $^{241}AmO_2$ in rats, 9:3399 (J;US)

**Radioecological Concentration**
Transuranium nuclides in pelagic and benthic components of test reactor leaching ponds, 9:3329 (RA;US)

**Single Intake**
Inhalation carcinogenesis of high fired $^{241}AmO_2$ in rats, 9:3399 (J;US)

**AMERICIUM 242 TARGET**

**Neutron Reactions**
Measurement of the /SUP 242m/ Am neutron fission cross section, 9:3936 (J;US)

**AMERICIUM COMPOUNDS**
*See also AMERICIUM FLUORIDES*

**Crystal Structure**
Crystallography and magnetic properties of transuranium element oxygen compounds (Np, Pu and Am), 9:3033 (R;FR;In French)

**Magnetic Properties**
Crystallography and magnetic properties of transuranium element oxygen compounds (Np, Pu and Am), 9:3033 (R;FR;In French)

**AMERICIUM FLUORIDES**

**Curie Point**
Magnetic properties of actinide elements having the $5f^6$ and $5f^7$ electronic configurations, 9:2781 (J;US)

**Magnetic Moments**
Magnetic properties of actinide elements having the $5f^6$ and $5f^7$ electronic configurations, 9:2781 (J;US)

**Magnetic Susceptibility**
Magnetic properties of actinide elements having the $5f^6$ and $5f^7$ electronic configurations, 9:2781 (J;US)

**AMINES**

Structure activity relationships: their function in biological prediction, 9:3403 (R;US)

**ANIONS**
*See also HYDROGEN IONS 1 MINUS*
**Beam Production**
Theoretical considerations associated with the production of negative ions in sputter-type ion sources, 9:3572 (J;US)

**ANTELOPES**
**Diet**
Seasonal soil ingestion rates by pronghorn and black-tailed jack rabbits, 9:3279 (RA;US)
**Ecology**
Sage grouse, pronghorn, and lagomorph use of a sagebrush-grassland burn site on the Idaho National Engineering Laboratory, 9:3309 (RA;US)

**ANTENNAS**
**Blast Effects**
Structural response of the SATCOM antenna to a blast loading, 9:3063 (RA;US)
**Computer Codes**
Numerical electromagnetics code - method of moments. User's guide supplement for NEC-3 for modeling buried wires, 9:3101 (R;US)

**ANTIBARYONS**
**Cosmology**
Generation of baryon excess in SU/sub L/$_2$ x SU/sub R/$_2$ x SU/sub c/$_4$, 9:3795 (R;XA)

**ANTIFERROMAGNETIC MATERIALS**
**Spin**
Correlation functions of electronic and nuclear spins in a Heisenberg antiferromagnet semi-infinite medium, 9:3516 (RA;BR;In Portuguese)

**ANTILAMBDA PARTICLES**
**Weak Particle Decay**
Measurement of CP violation in $\Lambda$ decay, 9:3683 (RA;US)
Polarizion experiments with hyperons, 9:3694 (RA;US)

**ANTIMONY**
**Ecological Concentration**
Trace element concentrations in different trophic levels near the site of a future coal-fired power plant and related facilities, 9:3282 (RA;US)
**Uptake**
Metals in maternal and fetal blood. Investigation of possible variations of the placental barrier function, 9:3406 (R;SE;In Swedish)

**ANTIMONY ALLOYS**
**Uses**
InAsSb strained-layer superlattices for long wavelength detector applications, 9:3209 (R;US)

**ANTIMUONS**
*See MUONS PLUS*

**ANTINEUTRINO-NUCLEON INTERACTIONS**
**Charged-Current Interactions**
nu-bar/sub $\mu$/-nucleon charged-current total cross section for 5—250 GeV, 9:3726 (J;US)
**Deep Inelastic Scattering**
Spin-spin asymmetries with $\nu$ and $\nu$-bar beams and polarized nucleons, 9:3794 (R;XA)
**Particle Production**
Experimental study of like-sign dimuons and of trimuons events produced in high energy neutrino and antineutrino interactions, 9:3732 (R;FR;In French)
**Polarized Targets**
Spin-spin asymmetries with $\nu$ and $\nu$-bar beams and polarized nucleons, 9:3794 (R;XA)

**ANTIPROTON REACTIONS**
**Experiment Planning**
Activation studies of the interactions of kaons, antiprotons, and high-energy pions with complex nuclei, 9:3874 (RA;US)
New horizons in nuclear physics, 9:3858 (RA;US)
New scientific information from LAMPF II, 9:3906 (RA;US)
**Fragmentation**
Nuclear fragmentation by relativistic $K^{+-}$, anti p, $\pi^{+-}$, and p projectiles, 9:3922 (RA;US)
**Multiple Scattering**
Measurement of anti p, $K^{+-}$, and $\pi^{+-}$ scattering from $^{16}$O and $^{18}$O at 800 MeV, 9:3871 (RA;US)

**ANTIPROTONIC ATOMS**
*See HADRONIC ATOMS*

**ANTIPROTONS**
**Origin**
Origin of low energy antiprotons in cosmic rays, 9:3443 (R;SU)
**Particle Production**
Production of pions, kaons, and muons by 16-GeV protons, 9:3768 (R;US)

**ANTIPYRINE**
**Labelling**
Synthesis of radiobrominated 4-bromoantipyrine for the measurement of cerebral blood flow, 9:3043 (J;GB)
**ANTIREFLECTION COATINGS**
**Damage**
Influence of deposition parameters on laser-damage threshold of silica-tantala AR coatings, 9:2789 (J;US)
Scandium oxide coatings for high-power UV laser applications, 9:2741 (J;US)
**ANTRIM SHALES**

Studies in the CdS/$Cu_2S$ heterojunction, 9:2821 (RA;BR;In Portuguese)
**CADMIUM TELLURIDES**
**Refractivity**
Linear and nonlinear intensity dependent refractive index of Hg/sub 1-x/Cd/sub x/Te, 9:2842 (J;US)
**Sample Preparation**
Effects of surface preparation on the properties of metal/CdTe junctions, 9:2843 (J;US)
**Surface Treatments**
Effects of surface preparation on the properties of metal/CdTe junctions, 9:2843 (J;US)
**CALCINED WASTES**
**Leaching**
Miscellaneous programs, 9:1929 (RA;US)
**Radiation Effects**
Radiation damage in nuclear waste ceramics, 9:2788 (J;US)
**CALCIUM**
**Diffusion**
Diffusion assisted by radiation as a surface protection method, 9:2694 (RA;BR;In Portuguese)
**Ecological Concentration**
Trace element concentrations in different trophic levels near the site of a future coal-fired power plant and related facilities, 9:3282 (RA;US)
**CALCIUM 40 REACTIONS**
**Fusion Reactions**
Inversion formula for the internucleus potential using sub-barrier fusion cross sections, 9:3876 (J;US)
**CALCIUM 40 TARGET**
**Calcium 40 Reactions**
Inversion formula for the internucleus potential using sub-barrier fusion cross sections, 9:3876 (J;US)
**Kaon Plus Reactions**
Conventional nuclear physics at LAMPF II: $K^+$-nucleus elastic and inelastic scattering, 9:3886 (RA;US)
**Pion Minus Reactions**
Dependence of the excitation energy, width, and cross section of the isovector monopole resonance, 9:3908 (R;US)
**Proton Reactions**
Energy dependence of the relativistic impulse approximation for proton-nucleus elastic scattering, 9:3889 (J;US)
**CALCIUM 48**
**Beta Decay**
No-neutrino double beta decay: more than one neutrino, 9:3706 (R;US)
**CALCIUM 48 TARGET**
**Kaon Plus Reactions**
Conventional nuclear physics at LAMPF II: $K^+$-nucleus elastic and inelastic scattering, 9:3886 (RA;US)
**CALCIUM CARBONATES**
**Dissolution**
Limestone dissolution in flue gas desulfurization processes. Final report Mar 79-Apr 83, 9:1797 (R;US)
**CALCIUM OXIDES**
**Catalytic Effects**
Importance of catalysis and carbon active sites in lignite char gasification, 9:1779 (D;US)

**Evaporation**
Investigation of the evaporation thermodynamics and stationary states (so-called "congruent states") in the study of oxides and their mixtures by the effusion method--application to $Al_2O_3$, CaO, and the mixtures $Al_2O_3$-CaO and $Ti_2O_3$-$TiO_2$, 9:2792 (J;US)

**CALCIUM SILICATES**
**Enthalpy**
Enthalpy of silicate melts from 1520 to 2600 K under ambient pressure (Liquid $SiO_2$, $CaSiO_3$, and $CaMgSi_2O_6$), 9:2869 (J;US)
**Specific Heat**
Enthalpy of silicate melts from 1520 to 2600 K under ambient pressure (Liquid $SiO_2$, $CaSiO_3$, and $CaMgSi_2O_6$), 9:2869 (J;US)

**CALIFORNIA**
*See also BRAWLEY GEOTHERMAL FIELD*
**Meteorology**
Characterization of reactants, reaction mechanisms, and reaction products leading to extreme acid rain and acid aerosol conditions in southern California. Final report May 81-May 83, 9:3266 (R;US)

**CALIFORNIUM 248**
**Heavy Ion Reactions**
Energy dependence of GITAsub(n)/GITAsub(f) partial widths ratio of neutron emission to fission for transuranium nuclei, 9:3931 (R;SU;In Russian)

**CALIFORNIUM 252**
**Isotope Production**
Transuranium-element processing, 9:3037 (RA;US)

**CALORIMETERS**
**Design**
Calorimeter for measuring ac magnetic losses in small samples, 9:3217 (J;US)
Experience with a double-compensating beam calorimeter, 9:3140 (J;US)

**CALORIMETERS (PARTICLE)**

Carbon 12 Reactions
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
Chemical Reactions
Interstitial and intercalation chemistry of the double-metal-layered yttrium monochloride, 9:2921 (J;US)
Reaction studies of hot silicon and germanium radicals. Progress report, September 1, 1982-September 30, 1983, 9:2908 (R;US)
Desorption
Angular distribution of desorpted atoms of solid surfaces, 9:2819 (RA;BR;In Spanish)
Ion Collisions
Dependence of multiple-scattering distributions on the charge states of fast ions exiting from solid targets, 9:3561 (J;US)
Iron 56 Reactions
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
Neon 20 Reactions
$^{20}$Ne induced peripheral reaction at 30 MeV/nucleon, 9:3869 (R;FR)
Neutron Reactions
Activation of the major constituents of tissue and air by a fast neutron radiation therapy beam, 9:3976 (J;US)
Charmed baryon Asub(c)sup(+) production by approximately 58 GeV neutrons on carbon, 9:3628 (R;SU)
Oxygen 16 Reactions
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
Oxygen 18 Reactions
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
Pion Minus Reactions
Differential cross section of eta meson production on carbon by $\pi^-$ mesons at the momentum of 3.3 GeV/c, 9:3632 (R;SU;In Russian)
Study on the dimensions of the radiation region of secondary negative pions produced in $\pi^-$ N and $\pi^-$ C interactions at 40 GeV/c in different reference frames, 9:3630 (R;SU;In Russian)
Pion Plus Reactions
Inclusive production of direct photons in 200-GeV/c collisions, 9:3719 (J;US)
Proton Reactions
Inclusive production of direct photons in 200-GeV/c collisions, 9:3719 (J;US)
Quantity Ratio
Analysis by SIMS and AES of H:$TiO_2$ electrodes, 9:2887 (RA;BR;In Spanish)
**CARBON 11**
Isotope Production
Cross sections for the production of $^{11}$C in C targets by $^{12}$C at relativistic energies, 9:3879 (J;US)
Radiochemistry
Preparation of carbon 11-labelled radiopharmaceuticals by the use of HPLC method, 9:3350 (R;FR;In French)
**CARBON 12**
Hypernuclei
Hypernuclear spectroscopy in the p shell, 9:3787 (J;US)
Weak decay of lambda hypernuclei, 9:3639 (RA;US)
**CARBON 12 REACTIONS**
Compound Nuclei
Demonstration of a large deformation in the first stage of the sequence reaction $^{12}$C($^{28}$Si,$\alpha\alpha$)$^{32}$S(g.s.) by analysis of angular correlation measurements, 9:3883 (R;FR;In French)
Compound-Nucleus Reactions
Demonstration of a large deformation in the first stage of the sequence reaction $^{12}$C($^{28}$Si,$\alpha\alpha$)$^{32}$S(g.s.) by analysis of angular correlation measurements, 9:3883 (R;FR;In French)
Fragmentation
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
Onset of damping in energetic heavy-ion interactions, 9:3897 (J;US)
Inclusive Interactions
Cross sections for the production of $^{11}$C in C targets by $^{12}$C at relativistic energies, 9:3879 (J;US)
Rutherford Scattering
Optical theorem and forward glory effects in heavy-ion scattering, 9:3942 (R;BR)
**CARBON 12 TARGET**
Carbon 12 Reactions
Cross sections for the production of $^{11}$C in C targets by $^{12}$C at relativistic energies, 9:3879 (J;US)
Kaon Minus Reactions
Hypernuclear spectroscopy in the p shell, 9:3787 (J;US)
Kaon Plus Reactions
Tests of the $K^+$-nucleon interaction in nuclei: an inelastic-scattering survey, 9:3873 (RA;US)
Nitrogen 14 Reactions
Projectile break-up of $^{14}$N at 62,7 MeV, 9:3870 (R;FR)
Pion Minus Reactions
Precompound analyses of spectra and yields following nuclear capture of stopped $\pi^-$, 9:3878 (J;US)
Pion Plus Reactions
Nuclear medium effects in pion elastic scattering and charge exchange, 9:3880 (J;US)
**CARBON 13**
Hypernuclei
Experiments with Λ hypernuclei, 9:3640 (RA;US)
How to populate bound hypernuclear levels, 9:3644 (RA;US)
Hypernuclear spectroscopy in the p shell, 9:3787 (J;US)
Measurement of $^{13}$C magnetic moment, 9:3641 (RA;US)
Isotope Effects
Stable isotope studies. Annual progress report, March 1, 1983-February 29, 1984, 9:2971 (R;US)
NMR Spectra
CP/MAS $^{13}$C NMR spectroscopic study of chlorophyll a in the solid state, 9:3345 (R;US)
Nuclear Magnetic Resonance
Nuclear magnetic resonance studies of amino acids and proteins. Side-chain mobility of metnionine in the crystalline amonio acid and in crystallne sperm whale (Physeter catodon) myoglobin, 9:3347 (J;US)
Spin Exchange
$^{13}$C spin diffusion of adamantane, 9:2811 (J;US)
**CARBON 13 REACTIONS**
Fusion Reactions
Inversion formula for the internucleus potential using sub-barrier fusion cross sections, 9:3876 (J;US)
**CARBON 13 TARGET**
Carbon 13 Reactions
Inversion formula for the internucleus potential using sub-barrier fusion cross sections, 9:3876 (J;US)
Kaon Minus Reactions
Hypernuclear spectroscopy in the p shell, 9:3787 (J;US)
Pion Minus Reactions
Analysis of elastic and inelastic scattering of 162 MeV pions from $^{13}$C by an optical potential and a collective model, 9:3882 (J;US)
Pion Plus Reactions
Analysis of elastic and inelastic scattering of 162 MeV pions from $^{13}$C by an optical potential and a collective model, 9:3882 (J;US)
Nuclear medium effects in pion elastic scattering and charge exchange, 9:3880 (J;US)

Desulfurization with transition metal catalysts, 9:1758 (R;US)
**Desulfurization**
Desulfurization with transition metal catalysts, 9:1758 (R;US)
**Distillation**
Nonstandard aging tests on coal-derived distillate fuel. Final report, July 7, 1981-July 6, 1983, 9:1760 (R;US)
**Fractionation**
Heteroatomic polycyclic aromatic hydrocarbons in coal liquids, 9:1811 (R;US)
**Infrared Spectra**
Systematic chemical-catalytic study of coal structure under subsoftening conditions, 9:1780 (D;US)
**Liquid Column Chromatography**
Heteroatomic polycyclic aromatic hydrocarbons in coal liquids. Rev., 9:3414 (R;US)
**Metabolic Activation**
Heteroatomic polycyclic aromatic hydrocarbons in coal liquids. Rev., 9:3414 (R;US)
**Mutagen Screening**
Heteroatomic polycyclic aromatic hydrocarbons in coal liquids. Rev., 9:3414 (R;US)
Heteroatomic polycyclic aromatic hydrocarbons in coal liquids, 9:1811 (R;US)
**Nuclear Magnetic Resonance**
Systematic chemical-catalytic study of coal structure under subsoftening conditions, 9:1780 (D;US)
**Physical Properties**
Fossil energy, 9:1769 (RA;US)
**Reviews**
Heteroatomic polycyclic aromatic hydrocarbons in coal liquids. Rev., 9:3414 (R;US)
**Stability**
Nonstandard aging tests on coal-derived distillate fuel. Final report, July 7, 1981-July 6, 1983, 9:1760 (R;US)
**Supercritical Gas Extraction**
Solvent tailoring in coal liquefaction based on critical properties of physical solvating agents and hydrogen donors, August 1, 1980-July 31, 1981, 9:1756 (R;US)
**Thermal Cracking**
Dissolution of coal in solvents, 9:1777 (D;US)
**Thermodynamic Properties**
Development of a thermodynamic-properties correlation framework for the coal-conversion industry. Final report, September 1, 1980-August 31, 1983, 9:1784 (R;US)
Development of a reference data system for the liquefaction-technology data base. Technical progress report, 1 April 1983-3 August 1983, 9:1761 (R;US)
**Toxicity**
Acute toxicity of water soluble fractions derived from a coal liquid (SCR-II) to three aquatic organisms, 9:3418 (J;NL)
**Vapor Pressure**
High P/T phase and volumetric behavior of coal-liquid constituents. Quarterly report, July 1, 1983-September 30, 1983 (Coal liquid model compounds), 9:1786 (R;US)

COAL MINING
Dusts
Evaluation of novel coal cutting concepts for reduced dust generation. Open file report 28 Sep 79-7 Jan 81, 9:1804 (R;US)
Evaluation
Evaluation of novel coal cutting concepts for reduced dust generation. Open file report 28 Sep 79-7 Jan 81, 9:1804 (R;US)
Mineral Wastes
Physical property data on coarse anthracite waste. Report of investigations, 9:1795 (R;US)
Occupational Safety
Mines Safety and Health Commission for the mining and other extractive industries. Its role in oil and gas exploration and extraction, 9:1847 (BA;GB)
Regulations
Addition of coal mining regulations to the Computer-Aided Environmental Legislative Data System (CELDS). Final report, 9:1812 (R;US)
COAL PREPARATION
Cost Benefit Analysis
Computer economics of physical coal cleaning and flue gas desulfurization, 9:1798 (R;US)
Desulfurization
Computer economics of physical coal cleaning and flue gas desulfurization, 9:1798 (R;US)
Mineral Wastes
Physical property data on coarse anthracite waste. Report of investigations, 9:1795 (R;US)
COAL PREPARATION PLANTS
Noise Pollution Abatement
Demonstrating the noise control of a coal preparation plant. Volume 2: long term treatment evaluation. Open file report Oct 77-Aug 81, 9:1806 (R;US)
Noise Pollution Control
Demonstrating the noise control of a coal preparation plant. Volume 2: long term treatment evaluation. Open file report Oct 77-Aug 81, 9:1806 (R;US)
COAL SEAMS
Degassing
Evaluation of gas producing potential from unmineable coal seams, 9:1877 (RA;US)
Information Systems
Data base for the analysis of compositional characteristics of coal seams and macerals. Final report: Part 4. Characterization of the organic structure of the Lower Kittanning coal seam using Fourier-transform infrared spectroscopy and optical properties, 9:1783 (R;US)
Thickness
Evaluation of gas producing potential from unmineable coal seams, 9:1877 (RA;US)
COAL-DERIVED LIQUIDS
*See COAL LIQUIDS*
COAL-FIRED MHD GENERATORS
*See also MHD GENERATOR CDIF*
Combustors
Coal-fired MHD Combustor Development Project. Phase IIIC. First quarterly technical progress report, 1 July-30 September 1983, 9:2583 (R;US)
Coal-fired MHD combustor development project: Phase IIIA. Final technical report, 9:2582 (R;US)
COAL-OIL MIXTURES
*See COAL*
*FUEL OILS*
*FUEL SLURRIES*
COATED FUEL PARTICLES
Fuel Element Failure
Fuel performance models for high-temperature gas-cooled reactor core design, 9:2239 (R;US)
Performance Testing
Irradiation performance of LEU fuel particle designs, 9:2247 (J;US)
TRISO-coated HTGR fuel pressure-vessel performance models, 9:2238 (R;US)
Radionuclide Migration
Experimental investigations of actinide release from coated fuel particles for high-temperature reactors, 9:2435 (R;DE;In German)
Stress Analysis
TRISO-coated HTGR fuel pressure-vessel performance models, 9:2238 (R;US)
COBALT
Biological Accumulation
Heavy metal and sulphur concentrations in Sphagnum magellanicum Brid. in the Maritime Provinces, Canada, 9:3415 (J;NL)
Catalytic Effects
Activity and selectivity studies on silica supported Fischer-Tropsch catalyst, 9:2995 (D;US)
Ecological Concentration
Trace element concentrations in different trophic levels near the site of a future coal-fired power plant and related facilities, 9:3282 (RA;US)
COBALT 58
Tissue Distribution
Biological elimination rates of radioisotopes by mallards contaminated at a liquid radioactive waste disposal area, 9:3393 (J;GB)
COBALT 60
Tissue Distribution
Biological elimination rates of radioisotopes by mallards contaminated at a liquid radioactive waste disposal area, 9:3393 (J;GB)
Uptake
Uptake of γ-emitting radionuclides by soils placed in test reactor leaching ponds, 9:3330 (RA;US)
COBALT ALLOYS
Catalytic Effects
Activity and selectivity studies on silica supported Fischer-Tropsch catalyst, 9:2995 (D;US)
COBALT CHLORIDES
Exchange Interactions
Neutron scattering study of a one-dimensional XY antiferromagnet $Cs_2CoCl_4$, 9:2841 (J;US)
Neutron Diffraction
Neutron scattering study of a one-dimensional XY antiferromagnet $Cs_2CoCl_4$, 9:2841 (J;US)
Order Parameters
Neutron scattering study of a one-dimensional XY antiferromagnet $Cs_2CoCl_4$, 9:2841 (J;US)
COBALT COMPLEXES
Physico-chemical investigation of some areas of fundamental significance to biophysics. Annual report, 1982-1983, 9:3001 (R;US)
Photochemical Reactions
Reactions of bis(dimethylglyoximato)cobalt(II) complexes with tert-butyl hydroperoxide, 9:2979 (J;US)
COBALT FLUORIDES
Crystal-Phase Transformations
Random fields and three-dimensional Ising models: Co/sub x/Zn/sub 1-x/$F_2$, 9:2854 (J;US)
Ising Model
Random fields and three-dimensional Ising models: Co/sub x/Zn/sub 1-x/$F_2$, 9:2854 (J;US)
Neutron Diffraction
Random fields and three-dimensional Ising models: Co/sub x/Zn/sub 1-x/$F_2$, 9:2854 (J;US)
COBALT OXIDES
Catalytic Effects
Catalysts for upgrading solvent refined lignite, 9:1778 (D;US)
Catalytic decomposition of gaseous $SO_3$, 9:2927 (J;US)
COGENERATION
*Prior to November 1980, this concept was indexed to CO-GENERATION.*
*See COGENERATION*
Research Programs
Department of Energy programs on cogeneration and their economics, 9:2548 (BA;US)
COGENERATION PLANTS
*See DUAL-PURPOSE POWER PLANTS*

**COILS (MAGNETIC)**
*See MAGNET COILS*
**COKE**
**Moisture**
Moisture determination by microwave heating, 9:1788 (R;US)
**Sorptive Properties**
Reduction of nitrogen monoxide by catalytically activated lignite coke, 9:1792 (R;DE;In German)
**COLD STORAGE**
Assessment of cool storage in commercial building applications, 9:2614 (R;US)
**COLLECTRONS**
*See SELF-POWERED NEUTRON DETECTORS*
**COLLISIONLESS PLASMA**
**Electric Currents**
Analysis of current drive by travelling wave based on theory of intrinsic stochasticity, 9:4065 (R;JP)
**COLOGNE SPIRITS**
*See ETHANOL*
**COLON**
*See LARGE INTESTINE*
**COLONIES**
*See POPULATIONS*
**COLORIMETRY**
*See ABSORPTION SPECTROSCOPY*
**COLUMBIUM**
*See NIOBIUM*
**COLUMN PACKING**
**Standards**
American National Standard: use of borosilicate-glass raschig rings as a neutron absorber in solutions of fissle material, 9:3075 (B;US)
**COLUMNS (MECHANICAL)**
*See MECHANICAL STRUCTURES*
**COMBINED GAS AND STEAM CYCLE POWER PLANTS**
*See COMBINED-CYCLE POWER PLANTS*
**COMBINED STEAM-POWER GENERATION**
*See COGENERATION*
**COMBINED-CYCLE POWER PLANTS**
*Prior to March, 1976, the descriptors COMBINED CYCLES and FOSSIL-FUEL POWER PLANTS or THERMAL POWER PLANTS were used for indexing this concept.*
**Coal Gasification**
Experimental simulation and advanced control aspects of the IGCC concept. Part I. Simulation results, 9:1751 (R;US)
**Performance Testing**
IGCC performance comparison for variations in gasifier type and gas turbine firing temperature, 9:2187 (R;US)
**COMBUSTION**
**Laser Spectroscopy**
Progress Report 1980-81-82, 9:3050 (R;SE)
**Raman Spectroscopy**
Broadband rotational CARS spectra of simple gases of interest in combustion diagnostics, 9:3049 (R;SE)
**Vortices**
Flame acceleration mechanisms under conditions of partial confinement. Annual report no. 2, Feb 82-Jan 8, 9:3051 (R;US)
**COMBUSTORS**
*See also FLUIDIZED-BED COMBUSTORS*
**Design**
Coal-fired MHD Combustor Development Project. Phase IIIC. First quarterly technical progress report, 1 July-30 September 1983, 9:2583 (R;US)
Coal-fired MHD combustor development project: Phase IIIA. Final technical report, 9:2582 (R;US)
**Fuel Substitution**
Direct combustion of industrial dry, composite waste in suspension. Final report, 9:2642 (R;US)
**Performance Testing**
Coal-fired MHD Combustor Development Project. Phase IIIC. First quarterly technical progress report, 1 July-30 September 1983, 9:2583 (R;US)
Coal-fired MHD combustor development project: Phase IIIA. Final technical report, 9:2582 (R;US)
**COMETS**
**Origin**
Formation of comets by radiation pressure in the outer protosun. II. Dependence on the radiation-grain coupling, 9:3469 (J;US)
Formation of comets by radiation pressure in the outer protosun. III. Dependence on the anisotropy of the radiation field, 9:3470 (J;US)
**COMMERCIAL BUILDINGS**
**Fuel Cell Power Plants**
Economic competitiveness of fuel cell onsite integrated energy systems, 9:2584 (R;US)
**Ventilation Systems**
Energy conservation of ventilation in commercial and public buildings. Basis. Method file, 9:2612 (R;FI;In Finnish)
**COMMERCIAL SECTOR**
**Energy Analysis**
Macroeconometric model to allow energy policy analysis on changing fuel, specific prices, and production capacities, 9:2531 (R;US)
**Radioactive Waste Disposal**
Regional low-level radioactive waste disposal sites: progress being made but new sites will probably not be ready by 1986, 9:2051 (R;US)
**COMMON MARKET**
**Energy Policy**
Historical overview of US coal exports, 1973-1982, 9:1809 (R;US)
**COMPACT TORUS**
*Prior to October 1982, this concept was indexed to THERMONUCLEAR DEVICES or to a particular experiment if known, e.g., REVERSE-FIELD PINCH.*
**Reverse-Field Pinch**
Compact-Toroid Fusion Reactor (CTOR) based on the field reversed theta pinch, 9:4205 (BA;XA)
**Theta Pinch**
Compact-Toroid Fusion Reactor (CTOR) based on the field reversed theta pinch, 9:4205 (BA;XA)
**COMPOSITE MATERIALS**
*See also CERMETS*
**Energy Losses**
Viscoelastic loss characteristics of cord rubber composites, 9:2802 (R;US)
**Fabrication**
Chemical vapor deposition fabrication of filament-reinforced composites for high temperature applications, 9:2806 (BA;US)
**Phase Studies**
Phase identification in $TiB_2Ni$ composites by analytical electron microscopy, 9:2797 (BA;US)
**Synthesis**
Preparation of high-temperature oxide-metal eutectic composites: a review, 9:2805 (J;US)
**COMPOSITE MODELS**
*See also QUARK MODEL*
**Gauge Invariance**
Family gauge symmetry from a composite model, 9:3785 (J;NL)
**Quantum Field Theory**
Relation $mr << 1$ in the preon model, 9:3825 (R;XA)
**Symmetry Breaking**
Relation $mr << 1$ in the preon model, 9:3825 (R;XA)
**COMPOUNDS (ORGANIC)**
*See ORGANIC COMPOUNDS*
**COMPTON EFFECT**
**Cross Sections**
Angle-averaged Compton cross sections, 9:3536 (R;US)
**COMPTON SCATTERING**
*See COMPTON EFFECT*
**COMPUTED TOMOGRAPHY**
*See COMPUTERIZED TOMOGRAPHY*
**COMPUTER CODES**
*Computer codes are indexed by their initial letter and CODES, e.g., A CODES. If the code name begins with a number the code is indexed to NUMBER CODES.*
*See also B CODES*

**C Codes**
Numerical experiments with CONCHAS-SPRAY: compression stroke of an external-chamber diesel engine, 9:3117 (R;US)
**D Codes**
DNAF-1: an analytical fallout prediction model and code. Final report 12 Mar 80-31 Oct 81, 9:3225 (R;US)
Multidomain, multirecord-type Datatrieve-11 databases, 9:4255 (R;US)
**G Codes**
GIN: integrated navigation and data acquisition system, 9:1816 (BA;GB)
**L Codes**
LARC: computer codes for Lagrangian analysis of stress-gauge data to obtain decomposition rates through correlation to thermodynamic variables, 9:3222 (R;US)
**M Codes**
Derivation of I/M benefits for pre-1981 light duty vehicles for low altitude, non-California areas, 9:2669 (R;US)
**N Codes**
Numerical electromagnetics code - method of moments. User's guide supplement for NEC-3 for modeling buried wires, 9:3101 (R;US)
**R Codes**
Oak Ridge National Laboratory ELMO Bumpy Torus radially resolved, time-dependent, one-dimensional transport code - user's guide, 9:4075 (R;US)
**S Codes**
Fault tree as a tool in safety analysis of nuclear power plants (SIFTA code), 9:2420 (RA;CA)
Use of the SYVAC computer code in assessing a nuclear fuel waste disposal concept, 9:1971 (RA;CA)
**T Codes**
One-dimensional nodal neutronics routines for the TRAC-BD1 thermal-hydraulics program, 9:2406 (R;US)
The TCLUST1 transient LMFBR intersubassembly heat transfer code, 9:2295 (J;US)
**W Codes**
WHISTBT: a 1-1/2-D radial-transport code for bumpy tori, 9:4074 (R;US)
**Z Codes**
Models and codes for the plasma edge region (Zephyr code), 9:4038 (R;GB)
**COMPUTER PROGRAMMING**
*See PROGRAMMING*
**COMPUTER PROGRAMS**
*See COMPUTER CODES*
**COMPUTER-AIDED DESIGN**
**Mathematical Models**
Some technical issues in geometric modeling, 9:4244 (R;US)
**Planning**
EE/NESD computer-aided engineering FY '84 plan, 9:4245 (R;US)
**COMPUTER-AIDED MANUFACTURING**
**Mathematical Models**
Some technical issues in geometric modeling, 9:4244 (R;US)
**COMPUTERIZED TOMOGRAPHY**
*An imaging technique in which transmission measurements of a narrow beam of rays, photons, or particles made at several different angles around an object may be used with a computer program to obtain a clear image of one plane*
**Contrast Media**
Application of contrast media in computer tomography, 9:3359 (RA;HU;In Hungarian, German)
**COMPUTERS**
*See also CDC COMPUTERS*
*CRAY COMPUTERS*
*MICROPROCESSORS*
**Uses**
Computations in plasma physics, 9:4123 (J;US)
High-energy physics, 9:3609 (J;US)
**CONCENTRATOR SOLAR CELLS**
*Prior to July, 1979 SOLAR CELLS or specific solar cells descriptors and SOLAR CONCENTRATORS were used to index this concept.*
**Fresnel Lens**
Linear Fresnel lens photovoltaic concentrator program, 9:2119 (R;US)
**Performance Testing**
Linear Fresnel lens photovoltaic concentrator program, 9:2119 (R;US)
**Research Programs**
Advanced photovoltaic concentrator cells. Final report, August 29, 1979-March 31, 1982, 9:2122 (R;US)
**CONCRETES**
*See also PRESTRESSED CONCRETE*
**Creep**
Mechanical properties of some portland cement concretes made with coal and coal waste as aggregates. Report of investigations, 9:1796 (R;US)
**Leaching**
Nuclear waste management, 9:1993 (RA;US)
**Matrix Materials**
Nuclear waste management, 9:1993 (RA;US)
**Mechanical Tests**
Concrete structures for the extraction, storage and carriage of hydrocarbons in offshore areas, 9:1834 (BA;GB)
**Solidification**
Nuclear waste management, 9:1993 (RA;US)
**Tensile Properties**
Mechanical properties of some portland cement concretes made with coal and coal waste as aggregates. Report of investigations, 9:1796 (R;US)
**Waste Product Utilization**
Mechanical properties of some portland cement concretes made with coal and coal waste as aggregates. Report of investigations, 9:1796 (R;US)
**CONDENSED AROMATICS**
*See also BENZANTHRACENE*
*BENZOPYRENE*

Metal surface deformation and subsurface defect structure: a microscopy correlation study, 9:2761 (BA;US)

**COPPER CHLORIDES**
**Phase Transformations**
Experiments with phase transitions at very high pressure. Final Report, 9:2825 (R;US)

**COPPER COMPLEXES**
Physico-chemical investigation of some areas of fundamental significance to biophysics. Annual report, 1982-1983, 9:3001 (R;US)
**Electrolysis**
Reversible sequential transfer of two electrons at the same potential in bis(1,3,5-triketonato)dicopper(II) complexes and their diamine Schiff bases. Effect of $Na^+$ and similar ions on the cyclic voltammetry, 9:2996 (J;US)
**ENDOR**
ENDOR study of bis(acetylacetonato)copper(II) in solid solution, 9:2956 (J;US)

**COPPER IONS**
**Energy Levels**
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)
**Oscillator Strengths**
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)

**COPPER OXIDES**
**Catalytic Effects**
Catalytic decomposition of gaseous $SO_3$, 9:2927 (J;US)
**Decomposition**
Use of oxides in thermochemical water-splitting cycles for solar heat sources: copper oxides, 9:2109 (R;US)
**Oxidation**
Physical mechanisms responsible by the spectral properties of selective surfaces, 9:2775 (RA;BR;In Portuguese)

**COPPER SULFIDES**
**Heterojunctions**
Studies in the CdS/$Cu_2S$ heterojunction, 9:2821 (RA;BR;In Portuguese)
**Photovoltaic Conversion**
Studies in the CdS/$Cu_2S$ heterojunction, 9:2821 (RA;BR;In Portuguese)

**CORE CATCHERS**
**Specifications**
System study on the development of a core catcher concept for light water reactors. Final report/main volume, 9:2429 (R;DE;In German)

**CORE FLOODING SYSTEMS**
**R Codes**
Improvement of core mass balance calculation in REFLA-1D/MODE1, 9:2434 (R;JP)

**CORES (REACTOR)**
*See REACTOR CORES*

**CORN STOVER**
*See AGRICULTURAL WASTES*

**CORONA COUNTERS**
**Sensitivity**
Neutron detection channel with a counter based on the SNM-14 corona counter, 9:3178 (R;SU;In Russian)

**COSMIC GAMMA BURSTS**
**Synchrotron Radiation**
Analysis of the Konus catalog of gamma-ray bursts with the thermal synchrotron model, 9:3477 (J;US)

**COSMIC GAMMA SOURCES**
**Cosmic Gamma Bursts**
Criteria for grasar action in astrophysical sources, 9:3465 (R;US)
**Spectra**
Gamma-gun in the center of the galaxy, 9:3466 (R;SU)

**COSMIC NEUTRINOS**
*Prior to July, 1975 information was indexed to NEUTRINOS.*
**Neutrino Detection**
Study of high-energy physics underground. Technical progress report, 9:3166 (R;US)

**COSMIC PARTICLES**
*See COSMIC RADIATION*

**COSMIC RADIATION**
*From sources other than the sun; not for SOLAR RADIATION.*
*See also COSMIC NEUTRINOS*
**Energy Spectra**
Origin of low energy antiprotons in cosmic rays, 9:3443 (R;SU)
**Microwave Radiation**
Low-frequency measurement of the spectrum of the cosmic background radiation, 9:3471 (J;US)
**Wave Propagation**
Implications of HEAO-3 data for the acceleration and propagation of galactic cosmic rays, 9:3455 (R;US)

**COSMIC X-RAY SOURCES**
**Cosmic Ray Detection**
Ten years of Vela x-ray observations, 9:3449 (R;US)
**Luminosity**
Electron-positron annihilation and the cosmic X-ray background, 9:3463 (R;US)

**X-Ray Spectra**
Evidence for an ~300 day period in Cygnus X-1, 9:3482 (J;US)

**COSMOGONY**
*See COSMOLOGY*

**COSMOLOGICAL MODELS**
**Electromagnetism**
Arrow of electromagnetic time and the generalized absorber theory, 9:3476 (J;US)
**Entropy**
Cosmological effects of primeval fermion degeneracy in the grand unified theories, 9:3486 (J;US)
**Higgs Model**
Problems with the new inflationary universe, 9:3472 (J;US)
**Lepton Number**
Cosmological effects of primeval fermion degeneracy in the grand unified theories, 9:3486 (J;US)
**Scalar Fields**
Possible mechanism of cosmological term cancellation, 9:3444 (R;SU)
**T Invariance**
Arrow of electromagnetic time and the generalized absorber theory, 9:3476 (J;US)

**COSMOLOGY**
Prospects for further unification, 9:3821 (R;US)
**Background Radiation**
Decay of long-lived particles in the early universe, 9:3485 (J;US)
**Many-Dimensional Calculations**
Entropy from extra dimensions, 9:3473 (J;US)

**COSMOS**

Energy. A continuing bibliography with indexes, issue 36, January 1983, 9:4256 (R;US)
**ENERGY CONSERVATION**
Municipal Energy Conservation Project. Final report, 9:2660 (R;US)
**Demonstration Programs**
Measuring effects of utility conservation programs: inputs to utility decision making, 9:2588 (R;US)
Residential conservation demonstration program. Final report, 9:2616 (R;US)
**Evaluation**
Energy conservation policies, 9:2536 (BA;US)
**Government Policies**
After energy price decontrol: The role of government conservation programs, 9:2557 (R;US)
**Marketing Research**
New York State Energy Office fuel-Oil Conservation Marketing Program. Final report, 9:2604 (R;US)
**Program Management**
Energy and economic development: a practical guide for the 1980's, 9:2589 (R;US)
Technical assistance for Project Conserve. Final report, 9:2591 (R;US)
**Training**
New York State Energy Office fuel-Oil Conservation Marketing Program. Final report, 9:2604 (R;US)
**ENERGY CONSUMPTION**
**Mathematical Models**
Analysis of medium-term economic development and energy consumptions through the EURECA-EXPLOR-EDM model chain. Final report, 9:2590 (R;XE)
**ENERGY DEMAND**
**Computer Codes**
Econometric estimates of the EDM model (Italian version of Frankfurt and Cambridge model), 9:2549 (R;XE)
**Economic Elasticity**
Macroeconometric model to allow energy policy analysis on changing fuel, specific prices, and production capacities, 9:2531 (R;US)
**Energy Models**
Macroeconometric model to allow energy policy analysis on changing fuel, specific prices, and production capacities, 9:2531 (R;US)
**Forecasting**
Macroeconometric model to allow energy policy analysis on changing fuel, specific prices, and production capacities, 9:2531 (R;US)
Overview of the Wharton School assessments of the short-term integrated forecasting system (STIFS), 9:2532 (R;US)
**ENERGY MODELS**
**S Codes**
Overview of the Wharton School assessments of the short-term integrated forecasting system (STIFS), 9:2532 (R;US)
**ENERGY POLICY**
Historical overview of US coal exports, 1973-1982, 9:1809 (R;US)
**Comparative Evaluations**
Analysis of the energy-political paths of the Enquete Commission, 9:2534 (R;DE;In German)
**ENERGY SOURCE DEVELOPMENT**
**Forecasting**
Potential production and consumption figures of indigenous fuels in Finland, 9:2571 (R;FI;In Finnish)
**Research Programs**
Energy Research Program. Final report, 1 September 1976-28 February 1982, 9:4232 (R;US)
**ENERGY SOURCES**
*See also FOSSIL FUELS*
*NUCLEAR FUELS*
*RENEWABLE ENERGY SOURCES*
*WOOD FUELS*
**Health Hazards**
Nuclear energy an unacceptable hazard to health, 9:2454 (J;GB)
**ENERGY STORAGE**
*See also HEAT STORAGE*
**Cost**
Breakeven costs of storage in optimized solar energy systems, 9:2147 (J;GB)
**Technology Assessment**
Assessment of energy storage for solar applications, 9:2145 (R;US)
**ENERGY SUPPLIES**
**Emergency Plans**
Analysis of the comprehensive energy emergency response procedures report, 9:2533 (R;US)
**ENERGY-LEVEL DENSITY**
**Boundary Conditions**
Density of states, Poisson's formula of summation and Walfisz's formula, 9:3745 (R;XA)
**ENERGY-LEVEL TRANSITIONS**
*See also EXCITATION*
**Probability**
To the theory of non-adiabatic transitions between degenerated states, 9:4001 (R;SU;In Russian)

**Catalysis**
Fischer-Tropsch catalysis. Annual report 1 Jun 81-31 May 82, 9:2076 (R;US)
**Catalysts**
Activity and selectivity studies on silica supported Fischer-Tropsch catalyst, 9:2995 (D;US)
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)
Moessbauer spectroscopic and related characterization of Fischer-Tropsch catalysts. Final report, 9:2070 (R;US)
**FISHES**
**Bacterial Diseases**
Impact of thermal loading and other water quality parameters on the epizootiology of Aeromonas hydrophila infections of centrarchids. Final report, 9:3402 (R;US)
**Biological Stress**
Impact of thermal loading and other water quality parameters on the epizootiology of Aeromonas hydrophila infections of centrarchids. Final report, 9:3402 (R;US)
**Blood Chemistry**
Impact of thermal loading and other water quality parameters on the epizootiology of Aeromonas hydrophila infections of centrarchids. Final report, 9:3402 (R;US)
**FISSILE MATERIALS**
**Criticality**
American National Standard: use of borosilicate-glass raschig rings as a neutron absorber in solutions of fissle material, 9:3075 (B;US)
Calculational results compared to benchmark critical experiments on annular tanks, 9:2035 (J;US)
**Tanks**
Calculational results compared to benchmark critical experiments on annular tanks, 9:2035 (J;US)
**FISSION**
**Cross Sections**
Comparisons of energy dependent point-wise cross-section generation codes: RESEND, RESENDD, RECENT, 9:3946 (R;JP)
**Nuclear Data Collections**
Comparisons of energy dependent point-wise cross-section generation codes: RESEND, RESENDD, RECENT, 9:3946 (R;JP)
**Saddle-Point Method**
Effect of dissipation on the eigensolutions near the fission saddle point, 9:3951 (J;US)
**FISSION PRODUCT RELEASE**
*Coordinate with descriptors for the area of release such as BIOSPHERE or COOLANTS, and for the specific fission products, if known.*
Fission product behavior and containment response models for use in PRA studies, 9:2490 (BA;US)
**FISSION PRODUCTS**
**After-Heat**
JNDC nuclear data library of fission products, 9:3909 (R;JP)
**Beta Decay**
JNDC nuclear data library of fission products, 9:3909 (R;JP)
**Delayed Neutrons**
Studies of neutron resonances in far-unstable nuclides via beta-delayed neutron energy spectra, 9:3899 (R;US)
**Energy-Level Transitions**
JNDC nuclear data library of fission products, 9:3909 (R;JP)
**Neutron Reactions**
JNDC nuclear data library of fission products, 9:3909 (R;JP)
**Separation Processes**
Basic science and technology, 9:1928 (RA;US)
**FISSIONABLE MATERIALS**
*See also FISSILE MATERIALS*
Neutron physical and thermohydraulic investigations on the fissile fuel production with spallation neutrons, 9:1924 (R;DE;In German)
**FISSIONABLE MATERIALS MANAGEMENT**

Irradiation testing of miniature fuel plates for the RERTR program, 9:2352 (RA;US)
Producibility studies using UAl/sub x/ for low enrichment fuel plates, 9:2354 (RA;US)
Status of uranium-silicon alloy fuel development for the RERTR program, 9:2351 (RA;US)
Status of fuel element technology for plate type dispersion fuels with high uranium density, 9:2355 (RA;US)

**Performance**
Caramel fuel in OSIRIS: the complete conversion of a high flux research to a low enriched fuel, 9:2363 (RA;US)

**Specifications**
Irradiation testing of miniature fuel plates for the RERTR program, 9:2352 (RA;US)

**FUEL POOLS**

**Criticality**
Low-density moderation in PWR fuel storage, 9:2233 (J;US)

**FUEL REPROCESSING**
*See REPROCESSING*

**FUEL REPROCESSING PLANTS**
*See also WAK*
*WEST VALLEY PROCESSING PLANT*

**Aerosol Monitoring**
Air monitoring requirements and alarm response procedures in reprocessing plants, 9:1962 (RA;CA)

**Government Policies**
Report: Reprocessing. Vol. 1. Representation and critical evaluation of technology, safety and the energy-political significance of reprocessing, 9:1935 (B;DE;In German)

**Off-Gas Systems**
Canadian development program for off-gas management in nuclear facilities, 9:2255 (RA;XA)

**Public Opinion**
Report: Reprocessing. Vol. 1. Representation and critical evaluation of technology, safety and the energy-political significance of reprocessing, 9:1935 (B;DE;In German)

**Radiation Monitoring**
Air monitoring requirements and alarm response procedures in reprocessing plants, 9:1962 (RA;CA)

**Specifications**
Handling and storage of high-level liquid wastes from reprocessing of spent fuel, 9:1961 (R;DE)

**FUEL RODS**

**Damage**
Severe fuel-damage scoping test performance (PWR), 9:2399 (R;US)

**Deformation**
Local heat transfer where heated rods touch in axially flowing water, 9:2436 (R;US)

**Reliability**
High-reliability PWR fuel, 9:2226 (J;US)

**Specifications**
High-reliability PWR fuel, 9:2226 (J;US)

**Thermal Conductivity**
Use of Kalman filter methods in analysis of in-pile LMFBR accident simulations, 9:2400 (R;US)

**Thermal Stresses**
Severe fuel-damage scoping test performance (PWR), 9:2399 (R;US)
**FUEL SHEATHS**

## G

**GADOLINIUM 146**
**Energy-Level Transitions**
Spherical, oblate, and prolate nuclear shapes near $^{146}$Gd, 9:3914 (J;US)
**GADOLINIUM 147**
**Energy-Level Transitions**
Spherical, oblate, and prolate nuclear shapes near $^{146}$Gd, 9:3914 (J;US)
**High Spin States**
Spherical, oblate, and prolate nuclear shapes near $^{146}$Gd, 9:3914 (J;US)
**Nuclear Deformation**
Spherical, oblate, and prolate nuclear shapes near $^{146}$Gd, 9:3914 (J;US)
**GADOLINIUM 153**
**Energy Levels**
Nuclear data sheets for A = 153, 9:3918 (J;US)
**Energy-Level Transitions**
Nuclear data sheets for A = 153, 9:3918 (J;US)
**GADOLINIUM IONS**
**Energy-Level Transitions**
$3p^6\,3d^9$-$3p^5\,3d^{10}$ transitions in cobaltlike ions from $Ba^{29+}$ to $Yb^{43+}$, 9:3591 (J;US)
**GADOLINIUM OXIDES**
**Fabrication**
Development and demonstration of an advanced extended-burnup fuel-assembly design incorporating urania-gadolinia. Third semi-annual progress report, April-September 1982, 9:2217 (R;US)
**GALACTIC EVOLUTION**
**Cosmological Models**
Nonlinear evolution of large-scale structure in the universe, 9:3478 (J;US)
**GALAXY CLUSTERS**
**BBGKY Equation**
Four-point function in the BBGKY hierarchy, 9:3488 (J;US)
**Statistics**
Correlation functions in a filamentary clustering prescription, 9:3480 (J;US)
**GALAXY NUCLEI**
*Central part of galaxies.*
**Cosmological Models**
Activity in the centers of galaxies, 9:3490 (BA;DE)
**Luminosity**
Upper limits to the annihilation radiation luminosity of Centaurus A, 9:3461 (R;US)
**Plasma Jets**
An electron-positron jet model for the galactic center, 9:3457 (R;US)
**Spectra**
Low-temperature positron annihilation, 9:3460 (R;US)
**Stellar Radiation**
The origin of the galactic annihilation radiation, 9:3464 (R;US)
**GALLBLADDER**
*See BILIARY TRACT*
**GALLIUM ANTIMONIDES**
**Chemical Bonds**
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
**Ion Channeling**
Ion dechanneling due to lattice strains in semiconductor superlattices, 9:2852 (J;US)
**Lattice Parameters**
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
**GALLIUM ARSENIDE SOLAR CELLS**
**Fabrication**
GaAs peeled-film solar cells. Final report, March 15, 1980-December 31, 1981, 9:2123 (R;US)

GALLIUM ARSENIDES
Backscattering
Ion channeling studies of InGaAs/GaAs strained-layer superlattices, 9:2836 (J;US)
Capacitance
Impact ionization near GaAs grain boundaries, 9:2835 (J;US)
Chemical Bonds
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
Crystal Structure
Structural properties of III-V zinc-blende semiconductors under pressure, 9:2848 (J;US)
Crystal-Phase Transformations
Structural properties of III-V zinc-blende semiconductors under pressure, 9:2848 (J;US)
Electroluminescence
Impact ionization near GaAs grain boundaries, 9:2835 (J;US)
Electron Diffraction
Structure-factor phase information from two-beam electron diffraction, 9:2858 (J;US)
Electron Mobility
Electron mobilities in In/sub 0.2/Ga/sub 0.8/As/GaAs strained-layer superlattices, 9:2839 (J;US)
Ion Channeling
Ion channeling studies of InGaAs/GaAs strained-layer superlattices, 9:2836 (J;US)
Strain measurements by channeling angular scans, 9:2830 (J;US)
Lattice Parameters
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
Phase Transformations
Experiments with phase transitions at very high pressure. Final Report, 9:2825 (R;US)
Photoluminescence
Photoluminescent properties of n-GaAs electrodes: applications of the dead-layer model to photoelectrochemical cells. Technical report, 9:2099 (R;US)
Sorptive Properties
Investigation of adsorption and catalytic decomposition of the systems ethanol on ZnO and $H_2/H_2O$ on ZnO/GaAs, 9:2911 (R;DE;In German)
Strains
Ion channeling studies of InGaAs/GaAs strained-layer superlattices, 9:2836 (J;US)
Strain measurements by channeling angular scans, 9:2830 (J;US)
Structure Factors
Structure-factor phase information from two-beam electron diffraction, 9:2858 (J;US)
Traps
Impact ionization near GaAs grain boundaries, 9:2835 (J;US)
GALLIUM IONS
Energy Levels
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)
Oscillator Strengths
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)
GALLIUM PHOSPHIDES
Charge Density
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
Chemical Bonds
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
Crystal Structure
Structural properties of III-V zinc-blende semiconductors under pressure, 9:2848 (J;US)
Crystal-Phase Transformations
Structural properties of III-V zinc-blende semiconductors under pressure, 9:2848 (J;US)
Heterojunctions
GaP/Al/sub x/Ga/sub 1-x/P heterojunction transistors for high-temperature electronic applications, 9:3104 (J;US)
Lattice Parameters
Structural origin of optical bowing in semiconductor alloys p, 9:2859 (J;US)
GALLSTONES
*See BILIARY TRACT*
GAMMA DETECTION
Energy Spectra
Gamma ray energy loss spectra simulation in NaI detectors with the Monte Carlo method, 9:3200 (B;BR;In Portuguese)
NaI Detectors
Gamma ray energy loss spectra simulation in NaI detectors with the Monte Carlo method, 9:3200 (B;BR;In Portuguese)
Solid Scintillation Detectors
Bismuth germanate as a high-energy gamma-ray detector, 9:3199 (J;US)
GAMMA DOSIMETRY
Chemical Dosemeters
Apparatus for determining radiation hazards from inhaled airborne radioiodine in a radioisotope production establishment, 9:3169 (RA;XA)
GAMMA FUEL SCANNING
Ge Semiconductor Detectors
Extended Burnup Demonstration Reactor Fuel Program: development of an intrinsic germanium detector gamma-scan system, 9:2195 (R;US)
GAMMA RADIATION
Dose Rates
American National Standard: neutron and gamma-ray flux-to-dose rate factors, 9:3977 (B;US)
Radiation Streaming
Benchmark experiment on D-T neutrons and secondary gamma rays streaming through a concrete bent duct, 9:3963 (R;JP)
Stray Radiation
Calculation of stray dose distributions of gamma and X radiation in homogeneous and inhomogeneous media by means of Monte-Carlo methods, 9:3972 (B;DE;In German)
GAMMA SOURCES
*For cosmic sources of gamma radiation use COSMIC GAMMA SOURCES.*
Design
Cesium-137 gamma-source considerations for dry-sludge irradiators, 9:2066 (R;US)
GAMMA SPECTRA
A Codes
APPLE-2: an improved version of APPLE code for plotting neutron and gamma ray spectra and reaction rates, 9:3176 (R;JP)
GAMMA SPECTROMETERS
Corrections
Development of a method to correct for coincidence losses in high count rate gamma-ray spectrometry, 9:3175 (RA;CA)
Dead Time
Development of a method to correct for coincidence losses in high count rate gamma-ray spectrometry, 9:3175 (RA;CA)
Pulse Pileup
Development of a method to correct for coincidence losses in high count rate gamma-ray spectrometry, 9:3175 (RA;CA)
GAMMA SPECTROSCOPY
Monte Carlo Method
Gamma ray energy loss spectra simulation in NaI detectors with the Monte Carlo method, 9:3200 (B;BR;In Portuguese)
GAMOW-TELLER DECAY
*See GAMOW-TELLER RULES*
GAMOW-TELLER RULES
Comparative Evaluations
Energetics of the Gamow-Teller resonances, 9:3941 (R;BR)
GAMOW-TELLER THEORY
*See GAMOW-TELLER RULES*
GAS ANALYSIS
Gamma Spectrometers
Isotope specific noble gas monitoring, 9:3174 (RA;CA)
GAS COOLANTS
*See GASES*
GAS COOLED FAST BREEDER REACTOR
*See GCFR REACTOR*

**GAS COOLED FAST BREEDER REACTORS**
*See GCFR TYPE REACTORS*
**GAS FIELDS**
*See NATURAL GAS FIELDS*
**GAS FUELED REACTORS**
**Feasibility Studies**
Gaseous fuel reactors for power systems, 9:2298 (B;US)
**Research Programs**
Gaseous fuel reactors for power systems, 9:2298 (B;US)
**GAS SPILLS**
**Mathematical Models**
Recent results in simulating LNG vapor dispersion over variable terrain. Revision 1, 9:1880 (R;US)
**Monitoring**
LLNL/NWC 1980 LNG spill tests. Burro series data report: the appendices, 9:1879 (R;US)
**Remote Sensing**
BAGI: a new concept for the detection and tracking of hazardous gases, 9:1881 (R;US)
**GAS TRACK DETECTORS**
**Design**
Instrument to detect vapor nucleation of superheated drops, 9:3197 (J;US)
**Fabrication**
Instrument to detect vapor nucleation of superheated drops, 9:3197 (J;US)
**GAS TURBINE ENGINES**
**Design**
Advanced Gas Turbine (AGT) powertrain system development for automotive applications, 9:2661 (R;US)
**Testing**
Advanced Gas Turbine (AGT) powertrain system development for automotive applications, 9:2661 (R;US)
**GAS UTILITIES**
**Rate Structure**
Federal Energy Regulatory Commission has expedited case processing; additional improvements needed, 9:2530 (R;US)
**GAS WELLS**
*See NATURAL GAS WELLS*
**GASEOUS EFFLUENTS**
*See GASEOUS WASTES*
**GASEOUS WASTES**
*See also EXHAUST GASES*
*FLUE GAS*
**Decontamination**
Conception principles for insuring an efficient iodine trapping function on the 1300 MWe light water reactor ventilation system, 9:2203 (RA;XA;In French)
**Denitrification**
Reduction of nitrogen monoxide by catalytically activated lignite coke, 9:1792 (R;DE;In German)
**Radioactive Waste Processing**
Treatment of concentrated waste for storage - fixation of concentrated gaseous waste, 9:1957 (R;DE)
**GASES**
*See also ELECTRON GAS and FERMI GAS.*

$CF_4$-$H_2$-Ne gas target for reproducible high yields of anhydrous $H^{18}F$, 9:3045 (J;GB)

**HYDROGEN**
**Adsorption**
Coadsorption and reaction of $H_2$ and CO on Raney nickel: neutron vibrational spectroscopy, 9:2082 (J;US)
Investigation of adsorption and catalytic decomposition of the systems ethanol on ZnO and $H_2/H_2O$ on ZnO/GaAs, 9:2911 (R;DE;In German)
The kinetics of hydrogen absorption-desorption by metals, 9:2069 (BA;US)
**Atom-Molecule Collisions**
Accurate calculations of the rate constants and kinetic isotope effects for tritium-substituted analogues of the H + $H_2$ reaction, 9:2931 (J;US)
Spectral distribution of $CO_2$ vibrational states produced by collisions with fast hydrogen atoms from laser photolysis of HBr, 9:3586 (J;US)
System-bath decomposition of the reaction path Hamiltonian. II. Rotationally inelastic reactive scattering of H+$H_2$ in three dimensions, 9:3553 (J;US)
**Binary Mixtures**
Development of a reference data system for the liquefaction-technology data base. Technical progress report, 1 April 1983-3 August 1983 (Methane, carbon dioxide, carbon monoxide, hydrogen: binary mixtures with organic solvents; ASPEN; also properties of pure organic solvents with equations), 9:1761 (R;US)
**Chemical Analysis**
Conversion of water to hydrogen for deuterium assay using uranium at 700 deg. C., 9:2888 (R;NZ)
**Chemical Bonds**
Strain-induced localization and electronically stimulated desorption and dissociation, 9:2840 (J;US)
**Chemical Reaction Kinetics**
Reduced dimensionality quantum rate constants for the D+$H_2$(v = 0) and D+$H_2$(v = 1) reactions on the LSTH surface, 9:2916 (J;US)
**Chemical Reaction Yield**
Formation of hydrogen atoms in pyrolysis of 2,2-dimethylpropane behind shock waves, 9:2978 (J;US)
Molecular beam study of the photochemistry of $S_1$ glyoxal, 9:3008 (J;US)
**Chemical Reactions**
Electron-transfer catalysis by surfactant vesicle stabilized colloidal platinum, 9:2923 (J;US)
Improved parametrization of diatomics-in-molecules potential energy surface for $Na(3p\ ^2P)+H_2 \rightarrow Na(3s\ ^2S)+H_2$, 9:2953 (J;US)
System-bath decomposition of the reaction path Hamiltonian. II. Rotationally inelastic reactive scattering of H+$H_2$ in three dimensions, 9:3553 (J;US)
**Chemisorption**
Chemisorption of atomic hydrogen in nickel, 9:2690 (RA;BR;In Portuguese)
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)
Hydrogen chemisorption on silicon (100) 2 x 1, 9:2759 (J;NL)
**Combustion**
Research on equipment survival in a hydrogen burn, 9:2453 (R;US)
**Consumption Rates**
Dissolution of coal in solvents, 9:1777 (D;US)
Investigations of reactor performance, role of inherent catalysts, hydrogen donor solvents, and PCT properties of coal liquids and slurries, 9:1762 (R;US)
**Desorption**
Angular distribution of desorpted atoms of solid surfaces, 9:2819 (RA;BR;In Spanish)
Strain-induced localization and electronically stimulated desorption and dissociation, 9:2840 (J;US)
The kinetics of hydrogen absorption-desorption by metals, 9:2069 (BA;US)
**Diffusion**
Gathering of material on regulations and specifications in nuclear engineering, concerning materials calculation and testing in consideration of the safety requirements of the licensing and supervisory procedures (constructional materials and components of nuclear power plants). 6. technical report. Review of the state of knowledge about hydrogen embrittlement of materials used in conventional and nuclear power plants, 9:2701 (R;DE;In German)
**Dissociation Energy**
Preparation and reactions of $Cr^-$. The Cr-H bond strength, 9:3029 (J;US)
**Electronic Structure**
Molecular clustering about a positive ion. Structures, energetics, and vibrational frequencies of the protonated hydrogen clusters $H^+_3$, $H^+_5$, $H^+_7$, and $H^+_9$, 9:3580 (J;US)
**Hadronic Atoms**
Sigma-minus hydrogenic atoms, 9:3647 (RA;US)
**Ion-Atom Collisions**
Electron capture by slow Fe/sup q/+ ions from hydrogen atoms and molecules, 9:3563 (J;US)
Isotope effect in electron-capture differential cross sections at intermediate energies, 9:3593 (J;US)
Theoretical studies of highly-ionized species. Progress report, March 1, 1983-February 28, 1984, 9:3509 (R;US)

**Ion-Molecule Collisions**
Electron capture by slow Fe/sup q/+ ions from hydrogen atoms and molecules, 9:3563 (J;US)
**Isotope Ratio**
Conversion of water to hydrogen for deuterium assay using uranium at 700 deg. C., 9:2888 (R;NZ)
**Mixing**
Hydrogen mixing in compartments with a high-velocity source, 9:2409 (R;US)
**Muonic Atoms**
Muon capture from the triplet hyperfine level in hydrogen (LAMPF II experiment planning), 9:3705 (RA;US)
**Phase Studies**
Vapor liquid equilibrium study of the $H_2CH_4$ system at low temperatures and elevated pressures. Research report (annual) Jan-Dec 79, 9:2077 (R;US)
**Photoelectron Spectroscopy**
Resonant multiphoton ionization of $H_2$ via the B $^1\Sigma^+$/sub u/, v = 7, J = 2 and 4 levels with photoelectron energy analysis, 9:3567 (J;US)
**Photoionization**
Resonant multiphoton ionization of $H_2$ via the B $^1\Sigma^+$/sub u/, v = 7, J = 2 and 4 levels with photoelectron energy analysis, 9:3567 (J;US)
**Raman Effect**
Observation of solitons in stimulated Raman scattering, 9:3558 (J;US)
**Separation Processes**
Phase and volumetric studies for methane/synthesis gas separations: the hydrogen-carbon monoxide-methane system. Annual report Jan-Dec 82, 9:2078 (R;US)
**Vibrational States**
Molecular clustering about a positive ion. Structures, energetics, and vibrational frequencies of the protonated hydrogen clusters $H^+_3$, $H^+_5$, $H^+_7$, and $H^+_9$, 9:3580 (J;US)

**HYDROGEN 1 TARGET**
**Neutron Reactions**
Weak nucleon-nucleon interaction in few body systems, 9:3861 (R;FR)
**Proton Reactions**
Energy variation of the analyzing power in the reaction p/sub pol/+p→d+$\pi^+$, 9:3728 (J;US)

**Coverings**
Test results of Thermal Ice Cap prototype and final comments. Final report, 9:2639 (R;US)
**Thermal Insulation**
Test results of Thermal Ice Cap prototype and final comments. Final report, 9:2639 (R;US)
**ICE CONDENSERS**
Hydrogen mixing in compartments with a high-velocity source, 9:2409 (R;US)
**Stress Analysis**
Ice-condenser containment loadings during severe accidents (PWR; BWR), 9:2445 (R;US)
**ICR HEATING**
Nonlinear magnetohydrodynamic. Summary of recent activity (Task I). Progress report, 9:4047 (R;US)
Research on modeling of FED/INTOR radio-frequency heating and studies of FED/INTOR impurity-control mechanisms. Final technical report, 9:4044 (R;US)
**Computerized Simulation**
Theory and simulation of RF heating and current drive, 9:4133 (BA;XA)
**Monte Carlo Method**
Monte Carlo studies of tandem-mirror plasmas interacting with waves in the ion-cyclotron range of frequencies (ICRF). Annual report, October 1, 1982-September 30, 1983, 9:4042 (R;US)
**IDAHO NATIONAL ENGINEERING LABORATORY**
*Prior to 1976 known as NRTS and older material is so indexed.*
**Antelopes**
Seasonal soil ingestion rates by pronghorn and black-tailed jack rabbits, 9:3279 (RA;US)
**Baseline Ecology**
Baseline vegetation data for a controlled burn site, 9:3278 (RA;US)
Effects of prescribed burning on nongame birds breeding in sagebrush communities - pre-burn phase, 9:3307 (RA;US)
Evaluating the effects of a prescribed burn on the foraging ecology of sage and Brewer's sparrows, 9:3306 (RA;US)
Idaho National Engineering Laboratory radioecology and ecology programs. 1983 progress report, 9:3288 (R;US)
Trace element concentrations in different trophic levels near the site of a future coal-fired power plant and related facilities, 9:3282 (RA;US)
**Birds**
Dispersal and harvest of sage grouse utilizing the test reactor area on the Idaho National Engineering Laboratory, 9:3342 (RA;US)
Ecological study of the American rough-legged hawk on the Idaho National Engineering Laboratory, 9:3317 (RA;US)
Raptor electrocutions on the Idaho National Engineering Laboratory (Aquila chrysaetos, Buteo lagopus, Buteo jamaicensis, Bubo virginianus, Falco sparverius, Falco mexicanus, Buteo regalis), 9:3426 (RA;US)

Raptor studies on the Idaho National Engineering Laboratory (Asio otus, Aquila chrysaetos, Haliaeetus leucocephalus), 9:3318 (RA;US)
Sage grouse census methods and populations in southeastern Idaho, 9:3341 (RA;US)
Sage grouse on the Idaho National Environmental Research Park, 9:3319 (RA;US)
**Fossils**
Late-Pleistocene vegetation history of the Idaho National Engineering Laboratory, 9:3427 (RA;US)
**Grass**
Plant and soil water relations at a prescribed burn site on the Idaho National Engineering Laboratory, 9:3311 (RA;US)
**Insects**
Insects associated with sagebrush communities at the Idaho National Engineering Laboratory, 9:3310 (RA;US)
**Plants**
Idaho National Engineering Laboratory vegetation data file, 9:3303 (RA;US)
Late-Pleistocene vegetation history of the Idaho National Engineering Laboratory, 9:3427 (RA;US)
Survey and assessment of the rare vascular plants of the Idaho National Engineering Laboratory, 9:3301 (RA;US)
**Rabbits**
Impacts of jack rabbit herbivory on sagebrush steppe vegetation, 9:3315 (RA;US)
Relationships of black-tailed jack rabbit diets to vegetal composition of habitats, 9:3312 (RA;US)
Seasonal soil ingestion rates by pronghorn and black-tailed jack rabbits, 9:3279 (RA;US)
**Radioactive Waste Facilities**
Iodine-129 in muscle of waterfowl using the test reactor area radioactive leaching ponds in southeastern Idaho, 9:3328 (RA;US)
Small mammal density and movement on the SL-1 disposal area, Idaho National Engineering Laboratory, 9:3291 (RA;US)
**Research Programs**
Idaho National Engineering Laboratory radioecology and ecology programs. 1983 progress report, 9:3288 (R;US)
**Rodents**
Long-term studies of relative density of rodents on the Idaho National Engineering Laboratory, 9:3316 (RA;US)
**Shrubs**
Plant and soil water relations at a prescribed burn site on the Idaho National Engineering Laboratory, 9:3311 (RA;US)
Sagebrush distributions on the Idaho National Engineering Laboratory, 9:3304 (RA;US)
**Soils**
Plant and soil water relations at a prescribed burn site on the Idaho National Engineering Laboratory, 9:3311 (RA;US)
**Wild Animals**
Coyote-leporid relations on the Idaho National Engineering Laboratory (Canis latrans, Lepus californicus), 9:3313 (RA;US)
Relative abundance of coyotes, lagomorphs, and rodents on the Idaho National Engineering Laboratory, 9:3314 (RA;US)

**Configuration Mixing**
Quark mixing angles in the left-right symmetric model with light W/sub R/ from $K^0$-$K^0$ mixing, 9:3803 (R;XA)
**Weak Particle Decay**
Considerations on a detector system for LAMPF II sensitive to $K^0$/sub L/ → μe at the $10^{-12}$ level, 9:3689 (RA;US)
CP symmetry in a high magnetic field, 9:3684 (RA;US)
Experiment to measure $eta_{000}$, 9:3682 (RA;US)
**KAONS NEUTRAL LONG-LIVED**
**Weak Particle Decay**
Consideration of a measurement of $(eta_{00})^2/(eta/sub +-/)^2$, 9:3681 (RA;US)
CP violation, 9:3813 (RA;US)
CP-violating polarization in K/sub μ3/⁺ and K/sub μ3/⁰ decays, 9:3680 (RA;US)
Determining the lifetime of the π/sup +-/μ/sup -+/ atom, 9:3698 (RA;US)
Experiment to measure the decay K/sub L/⁰ → $\pi^0 e^+ e^-$, 9:3679 (RA;US)
Experiment to measure the kaon beta decay rate (LAMPF II experiment planning), 9:3686 (RA;US)
**KAONS NEUTRAL SHORT-LIVED**
**Weak Particle Decay**
Consideration of a measurement of $(eta_{00})^2/(eta/sub +-/)^2$, 9:3681 (RA;US)
**KAONS PLUS**
**Bound State**
Search for $K^+$-nucleus states with positive strangeness by the ($K^+$,p) knockout reaction, 9:3903 (RA;US)
**Channeling**
$K^+/\mu^+$, $\pi^+/\mu^+$, and $\mu^+/e^+$ lattice steering in highly perfect crystals, 9:3964 (RA;US)
**Weak Particle Decay**
CP-violating polarization in K/sub μ3/⁺ and K/sub μ3/⁰ decays, 9:3680 (RA;US)
Experiment to study the decay $K^+ \rightarrow \pi^+$ nu anti nu, 9:3690 (RA;US)
Search for exotics in two-body decay of $K^+$: K/sub $\mu_2$/ and K/sub $\pi_2$/ revisited, 9:3687 (RA;US)
Searching for $K^+ \rightarrow \pi^+ \mu^+ e^-$ (LAMPF II experiment planning), 9:3688 (RA;US)
**KAPITZA RESISTANCE**
**Interfaces**
Kapitza resistance theory, 9:3526 (RA;BR;In Portuguese)

**LANTHANUM CHROMITES**
*See CHROMIUM OXIDES*
**LANTHANUM IONS**
**Energy-Level Transitions**
$3p^6\,3d^9$-$3p^5\,3d^{10}$ transitions in cobaltlike ions from $Ba^{29+}$ to $Yb^{43+}$, 9:3591 (J;US)
**LARGE INTESTINE**
**Biomedical Radiography**
Double contrast method - why is it to be used only at every colon examination, and not at the stomach, 9:3361 (RA;HU;In Hungarian, English)
**LASER FUSION REACTORS**
**Design**
Westinghouse ICF power plant design, 9:4208 (BA;XA)
**LASER ISOTOPE SEPARATION**
Apparatus for enrichment of uranium by double photoionization (Patent application), 9:1916 (TG;US)
Apparatus for isotopic separation using a high-frequency wave and coherent radiation (Patent application), 9:1917 (TG;US)
Process for separation of isotopes from a gaseous mixture (Patent application), 9:1920 (TG;US)
**Charge Exchange**
Process and apparatus for the separtaion of isotopes, 9:1915 (TG;US)
**Kinetics**
Process for isotope separation, 9:1918 (TG;US)
**Optical Pumping**
Optically-pumped mercury vapour cell in coaxial geometry. No. 1. Transport of resonance radiation, 9:2912 (R;US)
Optically-pumped mercury vapour cell in coaxial geometry. 2. Optical pumping by lines in the visible triplet, 9:2913 (R;US)
**Technology Assessment**
Status and prospects for lasers in isotope separation, 9:2064 (J;GB)
**LASER MATERIALS**
**Antireflection Coatings**
Scandium oxide coatings for high-power UV laser applications, 9:2741 (J;US)
**Reflective Coatings**
Scandium oxide coatings for high-power UV laser applications, 9:2741 (J;US)
**LASER RADIATION**
**Absorption**
Time-dependent study of radiation trapping by time-delayed two-photon absorption, 9:3538 (R;US)
**Harmonics**
Interpretation of Livermore third-harmonic-generation experiments, 9:3079 (J;US)
**Mathematical Models**
Interpretation of Livermore third-harmonic-generation experiments, 9:3079 (J;US)
**Polarization**
Interpretation of Livermore third-harmonic-generation experiments, 9:3079 (J;US)
**Uses**
Wafer-scale laser pantography: Fabrication of n-metal-oxide-semiconductor transistors and small-scale integrated circuits by direct-write laser-induced pyrolytic reactions, 9:3103 (J;US)
**LASER SPECTROSCOPY**
Resonance ionization mass spectrometry at Los Alamos National Laboratory, 9:3188 (R;US)
**LASER TARGETS**
**Blackbody Radiation**
Use of sharp autoionizing resonances for soft x-ray diagnosis of inertially confined fusion plasmas, 9:4137 (J;US)
**Soft X Radiation**
Use of sharp autoionizing resonances for soft x-ray diagnosis of inertially confined fusion plasmas, 9:4137 (J;US)
**X-Ray Spectroscopy**
Imaging x-ray spectrometer for laser fusion applications, 9:4138 (J;US)
**LASER-PRODUCED PLASMA**
**Brillouin Effect**
Stimulated Brillouin backscattering in long-scale-length plasmas, 9:4117 (J;US)
**Energy Absorption**
Mass-ablation rates in a spherical laser-produced plasma, 9:4195 (J;US)
**Energy Transfer**
Variation of laser absorption with plasma scalelength in long-scalelength plasmas, 9:4185 (R;US)
**Heat Flux**
Heat flux in the presence of shifting cold and hot electron Maxwellian distributions, 9:4061 (R;JP)
**Interferometry**
Use of sharp autoionizing resonances for soft x-ray diagnosis of inertially confined fusion plasmas, 9:4137 (J;US)
**Ions**
Generation of super-fast ions due to nonlinear processes near the quarter critical density in laser-produced plasmas, 9:4055 (R;JP)
**Magnetic Fields**
Evolution of spontaneous magnetic fields in an expanding laser-produced plasma, 9:4157 (R;SU;In Russian)
Observation of magnetic fields in laser-produced plasma using the Zeeman effect, 9:4184 (R;US)
**Plasma Diagnostics**
Mass-ablation rates in a spherical laser-produced plasma, 9:4195 (J;US)
**Plasma Waves**
Magnetic surface waves in plasmas, 9:4092 (J;US)
**Shock Waves**
Laser-driven shock wave studies in single and double-layered slab targets, 9:4155 (R;IL)
**Soft X Radiation**
Use of sharp autoionizing resonances for soft x-ray diagnosis of inertially confined fusion plasmas, 9:4137 (J;US)
**Ultraviolet Spectra**
$3p^6\,3d^9$-$3p^5\,3d^{10}$ transitions in cobaltlike ions from $Ba^{29+}$ to $Yb^{43+}$, 9:3591 (J;US)
**LASERS**

Photoinduced electron-transfer reactions in a chlorophyllide-pheophorbide cyclophane. A model for photosynthetic reaction centers, 9:3011 (J;US)
**Fluorescence**
Photoinduced electron-transfer reactions in a chlorophyllide-pheophorbide cyclophane. A model for photosynthetic reaction centers, 9:3011 (J;US)

**MAGNESIUM OXIDES**
**Absorptivity**
Charge and mass transfer involving hydrogen in MgO crystals thermochemically reduced at high temperatures, 9:2786 (J;US)

**Color Centers**
Charge and mass transfer involving hydrogen in MgO crystals thermochemically reduced at high temperatures, 9:2786 (J;US)
**Electron Collisions**
Charge and mass transfer involving hydrogen in MgO crystals thermochemically reduced at high temperatures, 9:2786 (J;US)
**Photoemission**
Luminescence from oxygen vacancies in MgO crystals thermochemically reduced at high temperatures, 9:2787 (J;US)
**Photoluminescence**
Charge and mass transfer involving hydrogen in MgO crystals thermochemically reduced at high temperatures, 9:2786 (J;US)
Luminescence from oxygen vacancies in MgO crystals thermochemically reduced at high temperatures, 9:2787 (J;US)
**Stress Relaxation**
Stress-relaxation technique for deformation studies in four-point bend tests: application to polycrystalline ceramics at elevated temperatures, 9:2799 (J;GB)
**Thermoluminescence**
Charge and mass transfer involving hydrogen in MgO crystals thermochemically reduced at high temperatures, 9:2786 (J;US)

**MAGNESIUM SILICATES**
**Enthalpy**
Enthalpy of silicate melts from 1520 to 2600 K under ambient pressure (Liquid $SiO_2$, $CaSiO_3$, and $CaMgSi_2O_6$), 9:2869 (J;US)
**Specific Heat**
Enthalpy of silicate melts from 1520 to 2600 K under ambient pressure (Liquid $SiO_2$, $CaSiO_3$, and $CaMgSi_2O_6$), 9:2869 (J;US)

**MAGNET COILS**
**Specifications**
Near-term tokamak reactor designs with high performance resistive magnets, 9:4201 (BA;XA)

**MAGNETIC BREMSSTRAHLUNG**
*See SYNCHROTRON RADIATION*

**MAGNETIC COILS**
*See MAGNET COILS*

**MAGNETIC COMPRESSION**
Optimized rotary flux compressors for powering laser flashlamps, 9:4190 (R;US)

**MAGNETIC FIELDS**

**Transmutation**
Cosmologic studies at LAMPF II: the production of cosmogenic nuclides by energetic secondary particles, 9:3445 (RA;US)

**METHANE**
**Binary Mixtures**
Development of a reference data system for the liquefaction-technology data base. Technical progress report, 1 April 1983-3 August 1983 (Methane, carbon dioxide, carbon monoxide, hydrogen: binary mixtures with organic solvents; ASPEN; also properties of pure organic solvents with equations), 9:1761 (R;US)
**Critical Temperature**
Electron attachment to oxygen in supercritical hydrocarbon fluids, 9:2976 (J;US)
**Detection**
Improvements to gas detection systems, 9:1838 (BA;GB)
**Emission Spectra**
Determination of moisture and trace impurities in helium by He($2^3$s) flowing afterglow, 9:2253 (J;NL)
**Ion-Molecule Collisions**
First observation of the Thomas peak in continuum capture: Capture of H atoms from $CH_4$ molecules by fast $Ar^+$ projectiles, 9:3555 (J;US)
**Migration**
Analysis of gases in the earth's crust. Annual report 1 Jan 82-31 Dec 82, 9:1870 (R;US)
**Monitoring**
Determination of moisture and trace impurities in helium by He($2^3$s) flowing afterglow, 9:2253 (J;NL)
**Natural Occurrence**
Geologic investigation of the methane potential of Western U.S. coal beds. Final report Dec 80-Jun 82, 9:1890 (R;US)
**Origin**
Analysis of gases in the earth's crust. Annual report 1 Jan 82-31 Dec 82, 9:1870 (R;US)
Studies related to the deep earth gas. Annual report Jan-Dec 82, 9:1871 (R;US)
**Oxidation**
Studies of poisoned catalysts by means of Auger electron spectroscopy and x-ray photoelectron spectroscopy (Catalytic gas detectors), 9:1899 (BA;GB)
**Phase Studies**
Vapor liquid equilibrium study of the $H_3CH_4$ system at low temperatures and elevated pressures. Research report (annual) Jan-Dec 79, 9:2077 (R;US)
**Production**
Amount of biogas and its availability for use in Finland, 9:2108 (R;FI;In Finnish)
Biogasification of Walt Disney World biomass waste blend. Annual report Jan-Dec 82, 9:2074 (R;US)
Evaluation of gas producing potential from unmineable coal seams, 9:1877 (RA;US)
Marine biomass program: anaerobic digestion systems development and stability study. Final report 1 Feb-31 Dec 82, 9:2079 (R;US)
**Purification**
Basic science and technology, 9:1928 (RA;US)
Phase and volumetric studies for methane/synthesis gas separations: the hydrogen-carbon monoxide-methane system. Annual report Jan-Dec 82, 9:2078 (R;US)
**Quantitative Chemical Analysis**
Portable, fast-response gas sensor for measuring methane and ethane and propane in liquefied natural gas spills, 9:2900 (J;US)
**Quantity Ratio**
Portable, fast-response gas sensor for measuring methane and ethane and propane in liquefied natural gas spills, 9:2900 (J;US)
**Recovery**
Evaluation of gas producing potential from unmineable coal seams, 9:1877 (RA;US)
**Separation Processes**
Phase and volumetric studies for methane/synthesis gas separations: the hydrogen-carbon monoxide-methane system. Annual report Jan-Dec 82, 9:2078 (R;US)
**Synthesis**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropech synthesis, 9:2081 (J;US)
Reduction of CO2 to methanol and methane by photo and dark reactions on semiconductor electrodes. Annual report Feb 82-Feb 83, 9:2075 (R;US)
**Uses**
Amount of biogas and its availability for use in Finland, 9:2108 (R;FI;In Finnish)

**METHANOL**
**Bioconversion**
Methanol bioconversion by Butyribacterium methylotrophicum--batch fermentation yield and kinetics, 9:2127 (J;US)

**Chemical Preparation**
Activity and selectivity studies on silica supported Fischer-Tropsch catalyst, 9:2995 (D;US)
**Storage Facilities**
Underwater storage tank system: a new conception for the storage of oil and methanol, 9:1864 (BA;GB)

NUCLEAR MAGNETIC RESONANCE
Uses
Quantitative determination of hydrogen by pulsed nuclear magnetic resonance spectroscopy, 9:2895 (R;US)
NUCLEAR MATERIALS DIVERSION
Government Policies
Decree No. 82-1050 of 13 December 1982 creating a Central Service for repression of illicit trading in weapons, munitions, explosive products and nuclear, biological and chemical materials, 9:2053 (R;FR;In French)
Motion Detection Systems
Development of an improved monitor for portal detection of the unauthorized removal of special nuclear material, 9:2057 (J;US)
NUCLEAR MATERIALS MANAGEMENT
Accounting
Attributes mode sampling schemes for international material accountancy verification, 9:2058 (J;US)
IAEA Safeguards
Measures for increasing IAEA safeguards effectiveness, 9:2059 (J;US)
Information Validation
Attributes mode sampling schemes for international material accountancy verification, 9:2058 (J;US)
Measures for increasing IAEA safeguards effectiveness, 9:2059 (J;US)
Inspection
Measures for increasing IAEA safeguards effectiveness, 9:2059 (J;US)
International Cooperation
Measures for increasing IAEA safeguards effectiveness, 9:2059 (J;US)
Material Balance
Attributes mode sampling schemes for international material accountancy verification, 9:2058 (J;US)
NUCLEAR MATTER
Collective, stochastic and nonequilibrium behavior of highly excited hadronic matter, 9:3770 (R;US)
Equations of State
Simplified equation of state near nuclear density, 9:3954 (J;NL)
Field Theories
Nonlinear mean field theory for nuclear matter and surface properties, 9:3953 (J;NL)
Many-Body Problem
Nonlinear mean field theory for nuclear matter and surface properties, 9:3953 (J;NL)
OPE Potential
Calculations of pion excess in nuclei, 9:3952 (J;US)
Phase Transformations
Phase transitions in nuclear matter and consequences for neutron stars, 9:3949 (R;DD)
Thermodynamics
States of matter in QCD, 9:3937 (RA;XC)
NUCLEAR PHYSICS
*Use only for indexing articles of very broad coverage, such as annual reviews, text books, etc.*
Research Programs
1981 Annual status report. Nuclear measurements, 9:3857 (R;XE)
Research in experimental nuclear physics. Progress report, 1 April 1983-31 March 1984 (University of Texas at Austin research at LAMPF), 9:3856 (R;US)
NUCLEAR POWER
Legal Aspects
Legal regime for the nuclear electricity-generating policy in France, 9:4269 (B;FR;In French)
NUCLEAR POWER PLANTS
Coordinated Research Programs
Role of the research and development center in the introduction of nuclear power in developing countries - Indian experience, 9:2394 (J;US)
Diesel Engines
Common cause failure rate estimates for diesel generators in nuclear power plants, 9:2499 (BA;US)
Economics
Nuclear customer services, 9:2469 (J;US)
Emergency Plans
Emergency plans for nuclear power accidents. Danish-Swedish exercise Oct 7th 1982, 9:2431 (R;SE;In Swedish)
Engineered Safety Systems
American National Standard: for safety-related cooling water systems in nuclear power plants, 9:2508 (B;US)
Availability analysis of standby safety systems, 9:2501 (BA;US)
Fault tree analysis using modular logic models, 9:2493 (BA;US)
Practical availability analysis of standby systems, 9:2315 (J;US)
In-Service Inspection
Inspection and maintenance plans. In-service inspections, 9:2339 (R;DE)
Licensing
Certification and qualification of suppliers and personnel for the Argentine nuclear program, 9:2307 (J;US)
Standardization and nuclear independence, 9:2483 (J;US)
Marketing
Nuclear customer services, 9:2469 (J;US)
Personnel
Overview of the need of manpower supply for a nuclear programme, 9:2311 (R;DE)
Overview of a procedure for human reliability analysis, 9:2313 (BA;US)
Utility considerations in emotional stability monitoring for nuclear plant personnel, 9:2194 (R;US)
Physical Protection
American National Standard: security for nuclear power plants, 9:2503 (B;US)
Professional Personnel
The program of cooperation between the King Abdulaziz University and the Swiss Federal Institute of Technology in the field of nuclear education and training, 9:2477 (J;US)
Quality Assurance
Certification and qualification of suppliers and personnel for the Argentine nuclear program, 9:2307 (J;US)
IRAM toward standardization in the nuclear field, 9:2484 (J;US)
Radiation Protection
Radiation protection technology transfer for overseas nuclear power stations, 9:2468 (J;US)
Reactor Accidents
Accident sequence evaluation for IREP, 9:2496 (BA;US)
Development of a data base for quantification of accident sequences, 9:2489 (BA;US)
Probabilistic methods for accident progression analysis, 9:2498 (BA;US)
Reactor Components
Structures for common-cause failure analysis, 9:2500 (BA;US)
Reactor Decommissioning
Community's research and development programme on decommissioning of nuclear power plants (year 1981). Annual progress report No. 2, 9:2442 (R;US)
Reactor Maintenance
Maintenance experience in Spain, 9:2473 (J;US)
Reactor Operation
Power reactor events, January-February 1983. Vol. 5, No. 1, 9:2438 (R;US)
Reactor Simulators
Simulator training for nuclear power plant operation in Brazil, 9:2478 (J;US)
Reactor Sites
American National Standard: criteria and guidelines for assessing capability for surface faulting at nuclear power plant sites, 9:2504 (B;US)

**Regulations**
International exchange of knowledge with regard to safety, 9:2481 (J;US)
Radiation protection technology transfer for overseas nuclear power stations, 9:2468 (J;US)
**Risk Assessment**
IREP human reliability analysis, 9:2495 (BA;US)
On issues important to the development of a systems interaction evaluation procedure, 9:2497 (BA;US)
Organization for the performance of PRA programs, 9:2488 (BA;US)
Overview of a procedure for human reliability analysis, 9:2313 (BA;US)
Probabilistic methods for accident progression analysis, 9:2498 (BA;US)
**Safety Standards**
IRAM toward standardization in the nuclear field, 9:2484 (J;US)
National and international standards in nuclear technology transfer, 9:2482 (J;US)
Standardization and nuclear independence, 9:2483 (J;US)
**Specifications**
American National Standard: criteria for technical specifications for nuclear power stations, 9:2509 (B;US)
**Standards**
Certification and qualification of suppliers and personnel for the Argentine nuclear program, 9:2307 (J;US)
**Technology Transfer**
Education-prerequisite to adequate technology transfer, 9:2474 (J;US)
Role of the research and development center in the introduction of nuclear power in developing countries - Indian experience, 9:2394 (J;US)
The program of cooperation between the King Abdulaziz University and the Swiss Federal Institute of Technology in the field of nuclear education and training, 9:2477 (J;US)
Transfer of educational programs to the nuclear utility industry, 9:2479 (J;US)
**Training**
Transfer of educational programs to the nuclear utility industry, 9:2479 (J;US)

**OFF-GAS SYSTEMS**
**Air Filters**
Analysis of the five years in-situ control of the cleaning filters used in the nuclear installations in France, 9:2344 (RA;XA;In French)
**Meetings**
Seminar on the testing and operation of off-gas cleaning systems at nuclear facilities, Karlsruhe, Germany, F.R., 3-7 May 1982, 9:1956 (R;XA)
**Performance**
Design, operation and in-plant testing of off-gas cleaning systems at BWRs, 9:2202 (RA;XA)
**OFFICE BUILDINGS**
**Energy Consumption**
Design methodology analysis: design and operational energy studies in a new high-rise office building. Volume 2, 9:2605 (R;US)
**OFFSHORE OPERATIONS**
**Data Acquisition Systems**
GIN: integrated navigation and data acquisition system, 9:1816 (BA;GB)
**Electronic Guidance**
Exact medium range (400 kilometres) radiolocation of vessels: the MEROPS system (medium range positioning system), 9:1824 (BA;GB)
GIN: integrated navigation and data acquisition system, 9:1816 (BA;GB)
**Positioning**
Exact medium range (400 kilometres) radiolocation of vessels: the MEROPS system (medium range positioning system), 9:1824 (BA;GB)
**Safety**
Safety of installations for work at sea, 9:1849 (BA;GB)
**OFFSHORE PLATFORMS**
*Includes gravity or fixed, floating, and towed platforms.*
**Construction**
State-of-the-art review in foundation design and analysis for tension leg platforms and vertically moored platforms. Final report (203 references), 9:1822 (R;US)
**Cost**
Application of a concrete articulated buoyant column to offshore drilling and production systems, 9:1833 (BA;GB)
**Design**
Application of a concrete articulated buoyant column to offshore drilling and production systems, 9:1833 (BA;GB)
BP development of tethered buoyant platform production system, 9:1830 (BA;GB)
Concrete structures for the extraction, storage and carriage of hydrocarbons in offshore areas, 9:1834 (BA;GB)
Design of two storage and loading floating platforms, 9:1831 (BA;GB)
Permanently located offshore structures the development of steel offshore jackets, 9:1832 (BA;GB)
State-of-the-art review in foundation design and analysis for tension leg platforms and vertically moored platforms. Final report (203 references), 9:1822 (R;US)
Subproject 2: an autonomous, manned, submersible catamaran equipment carrier - the Bruker Subcat, 9:1845 (BA;GB)
**Dimensions**
Design of two storage and loading floating platforms, 9:1831 (BA;GB)
**Foundations**
State-of-the-art review in foundation design and analysis for tension leg platforms and vertically moored platforms. Final report (203 references), 9:1822 (R;US)
**Hazards**
Improvements to gas detection systems, 9:1838 (BA;GB)
**Installation**
Application of a concrete articulated buoyant column to offshore drilling and production systems, 9:1833 (BA;GB)
**Leaks**
Improvements to gas detection systems, 9:1838 (BA;GB)
**Materials**
Application of a concrete articulated buoyant column to offshore drilling and production systems, 9:1833 (BA;GB)
Concrete structures for the extraction, storage and carriage of hydrocarbons in offshore areas, 9:1834 (BA;GB)
Design of two storage and loading floating platforms, 9:1831 (BA;GB)
**Performance**
Ben Ocean Lancer: a successful development programme for deepwater drilling, 9:1828 (BA;GB)
**Positioning**
Ben Ocean Lancer: a successful development programme for deepwater drilling, 9:1828 (BA;GB)
Deep sea drilling: extension of the dynamic positioning capacity by means of the long base, 9:1825 (BA;GB)
Operation of the special equipment installed on the dynamic stationing vessel Petrel, 9:1827 (BA;GB)
**Production**
BP development of tethered buoyant platform production system, 9:1830 (BA;GB)
**Safety**
Feasibility of leak detection in process plant on offshore installations, 9:1846 (R;NO)
Improvements to gas detection systems, 9:1838 (BA;GB)
Safety of installations for work at sea, 9:1849 (BA;GB)
**OGRA**
**Plasma Simulation**
Program complex for computation of the two-dimensional plasma distribution function in the OGRA-4 magnetic trap, 9:4052 (R;SU;In Russian)
**OHIO**
**Coal Deposits**
Data base for the analysis of compositional characteristics of coal seams and macerals. Final report: Part 4. Characterization of the organic structure of the Lower

Kittanning coal seam using Fourier-transform infrared spectroscopy and optical properties, 9:1783 (R;US)

**OIL BURNERS**
**Design**
Experimental investigation of fuel vaporization on combustion efficiency, 9:2620 (R;US)
**Performance**
Experimental investigation of fuel vaporization on combustion efficiency, 9:2620 (R;US)

**OIL FIELDS**
**Engineering**
Processing of geological and engineering data in multipay fields for evaluation, 9:1868 (RA;US)
**Engineering Geology**
Processing of geological and engineering data in multipay fields for evaluation, 9:1868 (RA;US)
**Evaluation**
Processing of geological and engineering data in multipay fields for evaluation, 9:1868 (RA;US)
**Geological Surveys**
Processing of geological and engineering data in multipay fields for evaluation, 9:1868 (RA;US)

**OIL FURNACES**
**Energy Efficiency**
Energy economical improvement of an oil heating system, 9:2625 (R;FI;In Finnish)

**OIL RESIDUES**
*See PETROLEUM RESIDUES*

**OIL SAND PROCESSING PLANTS**
**Monitoring**
Environmental monitoring reference manual for synthetic fuels facilities. Users manual Sep 82-May 83, 9:1799 (R;US)
**Process Heat Reactors**
Application of the HTGR in tar sands oil recovery, 9:1902 (RA;CA)

**OIL SHALE MINING**
**Earthmoving Equipment**
Evaluation of mechanical excavation systems for oil-shale mining. Final technical report, 9:1901 (R;US)
**Mining Equipment**
Evaluation of mechanical excavation systems for oil-shale mining. Final technical report, 9:1901 (R;US)

**OIL SHALE PROCESSING PLANTS**
**Monitoring**
Environmental monitoring reference manual for synthetic fuels facilities. Users manual Sep 82-May 83, 9:1799 (R;US)

**OIL SHALE WASTE WATER**
*See OIL SHALES*
*WASTE WATER*

**OIL SHALES**
*See also BLACK SHALES*
**Chemical Analysis**
Reproducibility of chemical analyses of raw Colorado oil shales, 9:1903 (R;US)
**Fluidized-Bed Combustion**
Fluidized combustion of oil shale. Final report, 9:1904 (R;US)

**OIL WELLS**
**Blowout Preventers**
Remote-control of a blowout preventer and instrumented pup-joint of a riser, 9:1826 (BA;GB)
**Blowouts**
Prevention of nuisance and pollution in off-shore exploration and exploitation of hydrocarbons, 9:1854 (BA;GB)
**Carbon Dioxide Injection**
Enhanced oil recovery by gas injection in a heavy-oil, fractured reservoir - Gela Field, Italy, 9:1840 (BA;GB)
**In-Situ Combustion**
Enhanced recovery in heavy crude and bitumen deposits, 9:1842 (BA;GB)
**Microemulsion Flooding**
Treatment fluids to improve sea water injection, 9:1841 (BA;GB)
**Offshore Drilling**
Deep sea drilling: extension of the dynamic positioning capacity by means of the long base, 9:1825 (BA;GB)
Remote-control of a blowout preventer and instrumented pup-joint of a riser, 9:1826 (BA;GB)
**Offshore Platforms**
State-of-the-art review in foundation design and analysis for tension leg platforms and vertically moored platforms. Final report, 9:1822 (R;US)
**Offshore Sites**
Automated underwater wellhead, 9:1839 (BA;GB)
Deep sea productions: construction and operation of a pump down tools testing station in a production well, 9:1835 (BA;GB)
North-East Grondin experimental station, 9:1836 (BA;GB)
**Steam Injection**
Development of methods for production of tar-oil in the Federal Republic of Germany, 9:1843 (BA;GB)
Enhanced recovery in heavy crude and bitumen deposits, 9:1842 (BA;GB)
**Underwater Facilities**
North-East Grondin experimental station, 9:1836 (BA;GB)
**Waterflooding**
Enhanced oil recovery by gas injection in a heavy-oil, fractured reservoir - Gela Field, Italy, 9:1840 (BA;GB)
**Well Servicing**
Deep sea productions: construction and operation of a pump down tools testing station in a production well, 9:1835 (BA;GB)
**Wellheads**
Automated underwater wellhead, 9:1839 (BA;GB)

Bremsstrahlung energy loss of degenerate plasma, 9:4164 (R;JP)
**Equilibrium**
Stability of equilibria with helical magnetic axis, 9:4083 (J;US)
Survey of free-boundary ion ring equilibria, 9:4095 (J;US)
**Fluctuations**
Fluctuation and radiation processes in bounded plasma-molecular systems, 9:4069 (R;SU;In Russian)
Growth rate of the clump instability, 9:4088 (J;US)
Reduced magnetohydrodynamics and the Hasegawa—Mima equation, 9:4091 (J;US)
**Heat Transfer**
Heat transport with cold and hot electrons allowing for flux limitation by Shvarts' method, 9:4197 (J;US)
**Helmholtz Instability**
Electrostatic Kelvin—Helmholtz instability in a radially injected plasma cloud, 9:4101 (J;US)
**Impurities**
Viscosity-driven impurity transport in a stellarator, 9:4085 (J;US)
**Ion Density**
Behavior of $Cs^+$-$UF^-_6$ ion-pair plasmas in radiofrequency quadrupole-dipole fields. I. Experiment, 9:3442 (J;US)

**Ion Temperature**
Measurements of plasma ion temperature and rotation velocity using the He II 4686-A line produced by charge transfer, 9:4079 (J;US)
**Ionization**
Mass spectra and ionization temperatures in an argon-nitrogen inductively coupled plasma, 9:3603 (J;US)
Technique to increase the $H^+$ ion fraction in a multicusp source, 9:4099 (J;US)
**Joule Heating**
Plasma heating with strong poloidal Ohmic currents, 9:4084 (J;US)
**Lifetime**
Particle lifetime scaling in field-reversed configurations based on lower-hybrid-drift resistivity, 9:4080 (J;US)
**Lower Hybrid Heating**
Parametric excitation of ion-sound quasimodes during lower-hybrid heating experiments in tokamaks, 9:4104 (J;US)
**Magnetic Field Configurations**
Magnetic islands and turbulence, 9:4050 (R;FR;In French)
**Magnetic Flux**
Magnetic reconnection driven by the coalescence instability, 9:4089 (J;US)
**Magnetohydrodynamics**
Application of the stellarator expansion for plasma stability studies in stellarators, 9:4106 (J;US)
Magnetic reconnection driven by the coalescence instability, 9:4089 (J;US)
Reduced magnetohydrodynamics and the Hasegawa—Mima equation, 9:4091 (J;US)
Theory of mode-induced beam particle loss in tokamaks, 9:4111 (J;US)
**Mass Spectra**
Mass spectra and ionization temperatures in an argon-nitrogen inductively coupled plasma, 9:3603 (J;US)
**Neutral-Particle Transport**
Theory of mode-induced beam particle loss in tokamaks, 9:4111 (J;US)
**Nonlinear Problems**
Magnetic reconnection driven by the coalescence instability, 9:4089 (J;US)
Reduced magnetohydrodynamics and the Hasegawa—Mima equation, 9:4091 (J;US)
Scaling of oblique plasma double layers, 9:4086 (J;US)
**Oscillation Modes**
Theory of mode-induced beam particle loss in tokamaks, 9:4111 (J;US)
**Photon Emission**
Fluctuation and radiation processes in bounded plasma-molecular systems, 9:4069 (R;SU;In Russian)
**Plasma Density**
Technique to increase the $H^+$ ion fraction in a multicusp source, 9:4099 (J;US)
**Plasma Drift**
Neoclassical flows and transport in nonaxisymmetric toroidal plasmas, 9:4087 (J;US)
**Plasma Instability**
Growth rate of the clump instability, 9:4088 (J;US)
Instability of fusing plasmas and spin-depolarization processes, 9:4119 (J;US)
Magnetic reconnection driven by the coalescence instability, 9:4089 (J;US)
**Plasma Waves**
Weak cubic Langmuir turbulence, 9:4102 (J;US)
**Polarization**
Fusion reactor plasmas with polarized nuclei, 9:4128 (BA;XA)
**Radiowave Radiation**
Behavior of $Cs^+$-$UF^-_6$ ion-pair plasmas in radiofrequency quadrupole-dipole fields. I. Experiment, 9:3442 (J;US)
**Refractivity**
Analytical approximations for the electron cyclotron absorption coefficient at the fundamental frequency in the Doppler regime, 9:4112 (J;US)
**Rotation**
Measurements of plasma ion temperature and rotation velocity using the He II 4686-A line produced by charge transfer, 9:4079 (J;US)
**Scaling Laws**
Particle lifetime scaling in field-reversed configurations based on lower-hybrid-drift resistivity, 9:4080 (J;US)
**Spin Flip**
Instability of fusing plasmas and spin-depolarization processes, 9:4119 (J;US)
**Stability**
Stability of equilibria with helical magnetic axis, 9:4083 (J;US)
**Transport Theory**
Neoclassical flows and transport in nonaxisymmetric toroidal plasmas, 9:4087 (J;US)
**Turbulence**
Magnetic islands and turbulence, 9:4050 (R;FR;In French)
Weak cubic Langmuir turbulence, 9:4102 (J;US)
**Ultraviolet Spectra**
Plasma spectral analysis using an image dissecting detector, 9:4097 (J;US)
**Viscosity**
Viscosity-driven impurity transport in a stellarator, 9:4085 (J;US)
**Visible Spectra**
Plasma spectral analysis using an image dissecting detector, 9:4097 (J;US)
**Wall Effects**
Critical plasma-materials issues for fusion reactor designs, 9:4217 (BA;XA)
**X-Ray Spectra**
Pulsed plasma source spectrometry in the 80—8000-eV x-ray region, 9:4096 (J;US)

Ion exchange and adsorption in nuclear chemical engineering, 9:2886 (R;US)

**Core Catchers**
System study on the development of a core catcher concept for light water reactors. Final report/main volume, 9:2429 (R;DE;In German)
Systems study for development of a core catcher for LWR-type reactors. Final report/materials, 9:2411 (R;DE;In German)

**Electrical Equipment**
Relationship of fire protection research to plant safety, 9:2452 (R;US)

**Failure Mode Analysis**
Interim results of the accident sequence evaluation program (ASEP), 9:2451 (R;US)

**Fission Product Release**
Aspects of retention of airborne $^{131}I$ in light water reactors during normal operation, 9:2201 (RA;XA)

**Fuel Assemblies**
Axial blanket fuel design and demonstration. Fourth progress report, April 1982-March 1983, 9:2216 (R;US)
Development and demonstration of an advanced extended-burnup fuel-assembly design incorporating urania-gadolinia. Third semi-annual progress report, April-September 1982, 9:2217 (R;US)
Fuel designs for light water reactors, 9:2228 (J;US)
Implementation of the active neutron coincidence collar for the verification of unirradiated PWR and BWR fuel assemblies, 9:2056 (BA;XA)
LOCA rupture strains and coolability of full-length PWR fuel bundles, 9:2443 (R;US)
Reliability breeds standardization in Combustion Engineering's fuel design, 9:2227 (J;US)

**Fuel Cans**
Effects of temperature and pressure on the in-reactor creepdown of Zircaloy fuel cladding, 9:2745 (J;US)

**Fuel Pellets**
Development and demonstration of an advanced extended-burnup fuel-assembly design incorporating urania-gadolinia. Third semi-annual progress report, April-September 1982, 9:2217 (R;US)

**Fuel Pins**
Fabrication, irradiation and post-irradiation examinations of $MO_2$ and $UO_2$ sphere-pac and $UO_2$ pellet fuel pins irradiated in a PWR loop, 9:2218 (R;XE)
Real-time nonlinear estimation of fuel-clad gap conductance, 9:2335 (J;US)

**Fuel Pools**
Low-density moderation in PWR fuel storage, 9:2233 (J;US)

**Fuel Racks**
Low-density moderation in PWR fuel storage, 9:2233 (J;US)

**Fuel Rods**
High-reliability PWR fuel, 9:2226 (J;US)
Severe fuel-damage scoping test performance, 9:2399 (R;US)

**Gaseous Wastes**
Conception principles for insuring an efficient iodine trapping function on the 1300 MWe light water reactor ventilation system, 9:2203 (RA;XA;In French)

**HPCI**
Feasibility study on feed and bleed for pressurized-water reactors, 9:2403 (R;US)

**Ice Condensers**
Ice-condenser containment loadings during severe accidents, 9:2445 (R;US)

**Loss of Coolant**
An assessment of the radiological consequences of postulated reactor accidents, 9:2480 (J;US)
Best estimate analysis of LOFT L3-6/L8-1 by RELAP4/MOD6/U4/J3, 9:2433 (R;JP)
Experience reprogramming TRAC for the HEP computer, 9:2460 (J;US)
LOCA rupture strains and coolability of full-length PWR fuel bundles, 9:2443 (R;US)
PWR small-break analysis using a PDP-11/AD-10 computer system, 9:2459 (J;US)
Safety and licensing issues that are being addressed by the Power Burst Facility test programs, 9:2510 (BA;FI)
SCTF Core-I test results. System pressure effects on reflooding phenomena, 9:2432 (R;JP)
Summary results of the LOCA Simulation Program conducted in NRU, 9:2444 (R;US)

**Meltdown**
Core melt/coolant interactions: modelling, 9:2447 (R;US)
Core melt/coolant interactions: experiments, 9:2446 (R;US)
High pressure melt ejection, 9:2449 (R;US)
Measurement of the thermal diffusivity of molten $UO_2$, 9:2465 (TG;US)

**Pipelines**
Reliability analysis for stiff versus flexible piping, 9:2206 (R;US)

**Plutonium Recycle**
Program of neutronic experiments for the qualification of calculation methods applied to reactor cores reloaded with U-Pu mixed fuels: synthesis report, 9:2196 (R;XE;In French)
Synthesis report of a reactor-physics programme devoted to the qualification of the project calculation methods applied to the mixed (U-Pu) fuelled reloadings, 9:2197 (R;XE)

**Power Distribution**
Power distribution and fuel depletion calculation for a PWR, using LEOPARD and CITATION codes, 9:2235 (B;BR;In Portuguese)

**Power-Cooling-Mismatch Accidents**
Safety and licensing issues that are being addressed by the Power Burst Facility test programs, 9:2510 (BA;FI)

**Pressure Vessels**
An empirical evaluation of a transition temperature shift in light water reactor pressure vessel steels, 9:2231 (J;US)
Application of crack arrest theory to a thermal shock experiment, 9:2237 (BA;US)
High pressure melt ejection, 9:2449 (R;US)
Light-water-reactor pressure-vessel surveillance dosimetry using solid-state track recorders, 9:2199 (R;US)
Pressure vessel steel irradiation embrittlement formulas derived from PWR surveillance data, 9:2230 (J;US)
Reassessment of PWR pressure-vessel integrity during overcooling accidents, 9:2398 (R;US)

**Pressurizers**
Model to simulate the dynamic of a PWR pressurizer using the CSMP program, 9:2236 (B;BR;In Portuguese)

**Primary Coolant Circuits**
Layout of the components: Primary system components (class I), 9:2416 (R;DE)
Reduction of numerical diffusion errors in thermal mixing predictions, 9:2232 (J;US)
The design, construction, and operation of a working PWR primary loop simulator, 9:2225 (J;US)

**Quality Assurance**
Quality assurance activities of PWR plants in Japan, 9:2234 (J;US)

**Radioactive Waste Processing**
American National Standard: liquid radioactive-waste-processing system for light-water-reactor plants, 9:2345 (B;US)

**Reactor Accidents**
Ice-condenser containment loadings during severe accidents, 9:2445 (R;US)
Interim results of the accident sequence evaluation program (ASEP), 9:2451 (R;US)
Nuclear Regulatory Commission programs, 9:2440 (RA;US)
Reassessment of PWR pressure-vessel integrity during overcooling accidents, 9:2398 (R;US)
SARRP: risk rebaselining and risk reduction analysis, 9:2448 (R;US)
Severe fuel-damage scoping test performance, 9:2399 (R;US)

**Reactor Cooling Systems**
American National Standard: overpressure protection of low-pressure systems connected to the reactor-coolant pressure boundary, 9:2214 (B;US)
Cooling systems, emergency cooling, recooling, 9:2412 (R;DE)
**Reactor Core Disruption**
Comparisons of the SCDAP computer code with bundle data under severe accident conditions, 9:2404 (R;US)
**Reactor Cores**
Axial blanket fuel design and demonstration. Fourth progress report, April 1982-March 1983, 9:2216 (R;US)
**Reactor Maintenance**
Operating experience with light-water reactors in Switzerland, 9:2308 (J;US)
Procedures for maintenance and repairs, 9:2222 (R;DE)
**Reactor Materials**
An empirical evaluation of a transition temperature shift in light water reactor pressure vessel steels, 9:2231 (J;US)
Application of crack arrest theory to a thermal shock experiment, 9:2237 (BA;US)
Initiation and propagation of stress-corrosion cracking of Alloy 600 in high-temperature water, 9:2215 (R;US)
Light-water-reactor pressure-vessel surveillance dosimetry using solid-state track recorders, 9:2199 (R;US)
Measurement of the thermal diffusivity of molten $UO_2$, 9:2465 (TG;US)
Pressure vessel steel irradiation embrittlement formulas derived from PWR surveillance data, 9:2230 (J;US)
**Reactor Operation**
Dynamics of a nuclear power plant. Behaviour of PWR plants in normal and upset operation, 9:2415 (R;DE)
Operating experience with light-water reactors in Switzerland, 9:2308 (J;US)
Power reactor events, January-February 1983. Vol. 5, No. 1, 9:2438 (R;US)
**Reactor Safety**
Dynamics of a nuclear power plant. Behaviour of PWR plants during malfunctions and accidents, 9:2414 (R;DE)
Layout of the components: Primary system components (class I), 9:2416 (R;DE)
Nuclear Regulatory Commission programs, 9:2440 (RA;US)
PWR and BWR safety systems layout, 9:2413 (R;DE)
Relationship of fire protection research to plant safety, 9:2452 (R;US)
**Reliability**
Review and analysis of insights from plant transients gained from the Interim Reliability Evaluation Program, 9:2450 (R;US)
**Risk Assessment**
Review and analysis of insights from plant transients gained from the Interim Reliability Evaluation Program, 9:2450 (R;US)
**Secondary Coolant Circuits**
Secondary systems of PWR and BWR, 9:2204 (R;DE)
**Standards**
Quality assurance activities of PWR plants in Japan, 9:2234 (J;US)
**Steam Generators**
Initiation and propagation of stress-corrosion cracking of Alloy 600 in high-temperature water, 9:2215 (R;US)
**Testing**
Safety and licensing issues that are being addressed by the Power Burst Facility test programs, 9:2510 (BA;FI)
**Transients**
Review and analysis of insights from plant transients gained from the Interim Reliability Evaluation Program, 9:2450 (R;US)
**Ventilation**
Workshop on safety analysis reports and licensing procedures. Pt. 1 A, 9:2223 (R;DE)
**Water Chemistry**
Chemical operating experience in several European pressurized water reactor plants, 9:2224 (R;DE)
Water systems, 9:2221 (R;DE)

**PYRAZINES**
**Biological Effects**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**Dose-Response Relationships**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**Mathematical Models**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**PYRENE**
**Diffusion**
Interplay between geometry and mobility in intramicellar kinetics, 9:2993 (J;DE)
**Dynamics**
Interplay between geometry and mobility in intramicellar kinetics, 9:2993 (J;DE)
**Excitation**
Interplay between geometry and mobility in intramicellar kinetics, 9:2993 (J;DE)
**PYRIDINE**
**Biological Effects**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**Dose-Response Relationships**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**Mathematical Models**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**PYRIDINES**
*See also ACRIDINES*
*BIPYRIDINES*
*PICOLINES*
*PYRIDINE*
*QUINOLINES*
**Chemical Radiation Effects**
Synthesis and ion exchange properties of grafted poly(p-phenylene terephthalamide) (Gamma rays), 9:1914 (B;ZA)
**PYRITE**
**Oxidation**
Investigation of the mechanics of mine acid formation in underground coal mine drainage. Open file report May 78-Jul 82, 9:1803 (R;US)
**Weathering**
Investigation of the mechanics of mine acid formation in underground coal mine drainage. Open file report May 78-Jul 82, 9:1803 (R;US)
**PYRITES**
*See PYRITE*
**PYROLYSIS**
**Chemical Reactors**
Charcoal as an alternative energy carrier. Pt.2: Conversion of biomass, 9:2072 (R;NO;In Norwegian)
**Reaction Kinetics**
Importance of catalysis and carbon active sites in lignite char gasification, 9:1779 (D;US)
**PZT**
**Mechanical Properties**
Effect of surface treatments on strength of PZT polycrystalline ceramics, 9:2800 (J;GB)

## Q

**QUADRUPOLE LINACS**
**Stabilization**
Vane coupling rings: a simple technique for stabilizing a four-vane radiofrequency quadrupole structure, 9:3125 (J;US)
**QUADRUPOLES**
**Construction**
Fermilab tevatron quadrupoles, 9:3123 (J;US)
**Design**
Fermilab tevatron quadrupoles, 9:3123 (J;US)

**Performance Testing**
Fermilab tevatron quadrupoles, 9:3123 (J;US)
**QUALITY ASSURANCE**
**Planning**
Draft issue of proposed document entitled Management Program to Assure Quality, 9:4234 (R;US)
**QUANTITATIVE CHEMICAL ANALYSIS**
**Nuclear Magnetic Resonance**
Quantitative determination of hydrogen by pulsed nuclear magnetic resonance spectroscopy, 9:2895 (R;US)
**QUANTUM CHROMODYNAMICS**
Quantum chromodynamics in few-nucleon systems, 9:3773 (R;US)
**CP Invariance**
CP invariance problem in the quantum chromodynamics, 9:3758 (RA;SU;In Russian)
**Eigenvalues**
Eigenvalue problem in the QCD simulating theory, 9:3751 (R;SU)
**Factorization**
Factorization and other novel effects in QCD, 9:3772 (R;US)
Problems at the interface between perturbative and nonperturbative quantum chromodynamics, 9:3771 (R;US)
**Fermions**
Link fermions and dynamically correlated paths for lattice gauge theory, 9:3847 (J;NL)
Surface description of QCD with fermionic quark boundaries, 9:3837 (R;IL)
**Hadron-Hadron Interactions**
Hadron physics at the SPS: Theoretical remarks, 9:3611 (RA;XC)
**Higgs Bosons**
Do light colored scalars exist?, 9:3848 (J;US)
**Mass Difference**
Critical analysis of the electromagnetic mass shift problem in QCD, 9:3741 (R;XA)
**Nuclear Matter**
States of matter in QCD, 9:3937 (RA;XC)
**P Invariance**
CP invariance problem in the quantum chromodynamics, 9:3758 (RA;SU;In Russian)
**Quarks**
Surface description of QCD with fermionic quark boundaries, 9:3837 (R;IL)
**Renormalization**
Problems at the interface between perturbative and nonperturbative quantum chromodynamics, 9:3771 (R;US)
**Research Programs**
Hadron physics at the SPS: Theoretical remarks, 9:3611 (RA;XC)
**Solitons**
Baryons as chiral solitons, 9:3816 (J;US)
**Supersymmetry**
Supersymmetry breaking by instantons, 9:3815 (J;US)
**Symmetry Breaking**
Do light colored scalars exist?, 9:3848 (J;US)
Spontaneous symmetry breakdown: Analogies and differences between superconductivity, quantum chromodynamics, and quantum flavordynamics, 9:3817 (J;US)
**QUANTUM ELECTRODYNAMICS**
*See also SCHWINGER-TOMONAGA FORMALISM*
Present state of quantum electrodynamics, 9:3830 (RA;SU;In Russian)
**Axial-Vector Currents**
New solution for the Schwinger model, 9:3822 (R;XA)
**QUANTUM FIELD THEORY**
*See also LATTICE FIELD THEORY*
*PHI4-FIELD THEORY*
*QUANTUM CHROMODYNAMICS*
*QUANTUM ELECTRODYNAMICS*
*QUANTUM FLAVORDYNAMICS*
**Algorithms**
Symbolic evaluation of some multidimensional integrals by the computer algebraic manipulations, 9:4013 (R;SU;In Russian)
**Graded Lie Groups**
Supergroup extensions: from central charges to quantization through relativistic wave equations, 9:3823 (R;XA)
**Integrals**
Symbolic evaluation of some multidimensional integrals by the computer algebraic manipulations, 9:4013 (R;SU;In Russian)
**Parastatistics**
Symmetry and symmetry breaking in generalized parastatistics, 9:3846 (J;US)
**Spinor Fields**
Eight-fold way to colour geometrodynamics, 9:3791 (R;XA)
**Symmetry Breaking**
Symmetry and symmetry breaking in generalized parastatistics, 9:3846 (J;US)
**QUANTUM FLAVORDYNAMICS**
**Symmetry Breaking**
Spontaneous symmetry breakdown: Analogies and differences between superconductivity, quantum chromodynamics, and quantum flavordynamics, 9:3817 (J;US)
**QUANTUM MECHANICS**
**Many-Body Problem**
Quantum collision theory with phase-space distribution functions, 9:4027 (J;US)
**Potential Scattering**
Quantum collision theory with phase-space distribution functions, 9:4027 (J;US)
**Schwinger Variational Method**
Schwinger variational method for the Bloch equation, 9:4025 (J;US)
**QUANTUM OPERATORS**
**Heisenberg Picture**
Heisenberg operators of generalized Toda lattice, 9:4002 (R;SU)
**QUARK CONFINEMENT**
*See BAG MODEL*
**QUARK MATERIAL**
*See QUARK MATTER*
**QUARK MATTER**
Collective, stochastic and nonequilibrium behavior of highly excited hadronic matter, 9:3770 (R;US)
**QUARK MODEL**

One method to calculate of color factors of Feynman diagrams, 9:3806 (R;SU;In Russian)
**QUARKS**
**Composite Models**
Complex Rishon-type unification, 9:3835 (R;IL)
Composite model for quarks and leptons, 9:3836 (R;IL)
Quark mixing matrix in a composite model, 9:3782 (J;US)
**Configuration Mixing**
Quark mixing in weak interactions, 9:3788 (J;NL)
**Detection**
Quark search at the CBA, 9:3610 (R;US)
**Lifetime**
Lifetime of particles containing b quarks, 9:3717 (J;US)

**Mass**
Note in the msub(quark) dependence of <q-barq> from chiral perturbation theory, 9:3750 (R;XA)
T quark mass in the SO-(10) symmetry, 9:3810 (RA;SU;In Russian)
**Mass Difference**
Critical analysis of the electromagnetic mass shift problem in QCD, 9:3741 (R;XA)
**Matrix Elements**
Quark mixing matrix in a composite model, 9:3782 (J;US)
**Particle Identification**
Search for fractional charges in water, 9:3724 (J;US)
**Perturbation Theory**
Note in the msub(quark) dependence of <q-barq> from chiral perturbation theory, 9:3750 (R;XA)
**Quantum Field Theory**
Are lepton and quark families quantized dynamical systems, 9:3742 (R;XA)
**Selection Rules**
Glueballs multiquark states and the OZI rules, 9:3775 (R;IL)
**SO-10 Groups**
T quark mass in the SO-(10) symmetry, 9:3810 (RA;SU;In Russian)
**Unified Gauge Models**
Quark-lepton unification and proton decay, 9:3792 (R;XA)
**Weak Particle Decay**
Quark flavor identification in electron-positron annihilation, 9:3707 (R;US)

**QUARTZ**
**Acoustic ESR**
Multipulse sequences in electron-spin echoes, 9:3215 (J;US)
**Crystal Structure**
Ab initio calculation of interatomic force constants in $H_6Si_2O_7$ and the bulk modulus of $\alpha$ quartz and $\alpha$ cristobalite, 9:2880 (J;DE)
**Interatomic Forces**
Ab initio calculation of interatomic force constants in $H_6Si_2O_7$ and the bulk modulus of $\alpha$ quartz and $\alpha$ cristobalite, 9:2880 (J;DE)
**Luminescence**
Shock-induced luminescence from X-cut quartz and Z-cut lithium niobate, 9:2827 (R;US)
**Physical Radiation Effects**
Modification of point defects in quartz for device applications, 9:2829 (R;US)

**QUASIPARTICLE-PHONON MODEL**
Do spin and charge- exchange resonances possess a R(4)-symmetry, 9:3939 (R;BR)

**QUINOLINES**
**Biological Effects**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**Dose-Response Relationships**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)
**Mathematical Models**
Structure activity relationships: their function in biological prediction, 9:3403 (R;US)

## R

**R PROCESS**
**Neutron Reactions**
Neutron capture rates in the r-process: the role of direct radiative capture[1], 9:3479 (J;US)

**R REACTOR**
**Thermal Pollution**
Thermal-effects study, 9:2342 (R;US)

**R-A REACTOR**
**Contamination**
Airborne radioactivities in the gas cooling and ventilation systems of the research reactor RA-Vinca, 9:2378 (RA;XA)

**RA-3 REACTOR**
**Fuel Elements**
LEU fuel development activities in Argentina, 9:2360 (RA;US)
Status of RA3 conversion studies, 9:2371 (RA;US)

**RABBITS**
**Contamination**
Black-tailed jack rabbit movements and habitat utilization at the Idaho National Engineering Laboratory radioactive waste management complex, 9:3295 (RA;US)
**Diet**
Impacts of jack rabbit herbivory on sagebrush steppe vegetation, 9:3315 (RA;US)
Relationships of black-tailed jack rabbit diets to vegetal composition of habitats, 9:3312 (RA;US)
Seasonal soil ingestion rates by pronghorn and black-tailed jack rabbits, 9:3279 (RA;US)
**Ecology**
Sage grouse, pronghorn, and lagomorph use of a sagebrush-grassland burn site on the Idaho National Engineering Laboratory, 9:3309 (RA;US)
**Environmental Effects**
Impacts of jack rabbit herbivory on sagebrush steppe vegetation, 9:3315 (RA;US)
**Population Density**
Relationships of black-tailed jack rabbit diets to vegetal composition of habitats, 9:3312 (RA;US)
Relative abundance of coyotes, lagomorphs, and rodents on the Idaho National Engineering Laboratory, 9:3314 (RA;US)
**Population Dynamics**
Impacts of jack rabbit herbivory on sagebrush steppe vegetation, 9:3315 (RA;US)
**Predator-Prey Interactions**
Raptor studies on the Idaho National Engineering Laboratory (Asio otus, Aquila chrysaetos, Haliaeetus leucocephalus), 9:3318 (RA;US)
Relative abundance of coyotes, lagomorphs, and rodents on the Idaho National Engineering Laboratory, 9:3314 (RA;US)
**Radiation Doses**
Ecological vectors of radionuclide transport at a solid radioactive waste disposal facility in southeastern Idaho, 9:3289 (RA;US)

**RADIATION ACCIDENTS**
**Emergency Plans**
Technical bases for offsite emergency planning at SRP, 9:2401 (R;US)

**RADIATION BURDEN**

Decree of 25 September 1982 amending Ministerial Decree of 27 July 1966 on conditions for notifying possession of radioactive materials and for annual updating of records thereof, 9:2054 (R;IT;In Italian)
Order of 9 November 1981 on exemptions from the Radioactive Substances Act, 9:2052 (R;DK;In Danish)
**Transport**
Radioactive Ores and Concentrates (Packaging and Transport) Act 1980. No. 26 of 1980, 9:1937 (R;AU)
**Transport Regulations**
Report of consultants to the IAEA on requirements for the safe transport of low hazard radioactive materials, 9:1923 (R;DE)

**RADIOACTIVE PARTICULATES**
*See RADIOACTIVE AEROSOLS*

**RADIOACTIVE TRACERS**
*See RADIOPHARMACEUTICALS*
*TRACER TECHNIQUES*

**RADIOACTIVE WASTE DISPOSAL**
**Alpha-Bearing Wastes**
A technology implementation perspective on defense transuranic waste management, 9:2028 (J;US)
Policy directions: Department of Energy transuranic waste management programs, 9:2027 (J;US)
Some chemical issues involved in the management and disposal of TRU wastes, 9:2029 (J;US)
The certification program of transuranic wastes at INEL, 9:2032 (J;US)
Transuranic waste management: technology status and needs, 9:2031 (J;US)
WIPP: the solution to disposal of defense transuranic waste, 9:2030 (J;US)
**Backfilling**
Mass transport from a waste emplaced in backfill and rock, 9:2017 (J;US)
**Comparative Evaluations**
Low-level waste disposal technology, 9:2011 (J;US)
**Computerized Simulation**
A systems modeling approach to evaluating low-level waste disposal systems, 9:2008 (J;US)
Use of the SYVAC computer code in assessing a nuclear fuel waste disposal concept, 9:1971 (RA;CA)
**Containers**
Design of containment for the long-term isolation of irradiated fuel during underground disposal, 9:1970 (RA;CA)
Waste packages for high-level waste repositories, 9:2014 (J;US)
**Coordinated Research Programs**
Scientific cooperation agreement on an investigation and surveillance programme on the site for radioactive waste disposal in the North-East Atlantic between the Nuclear Research Centre (CEN), Belgium and the National Laboratory of Industrial Engineering and Technology (LNETI), Portugal, 9:1985 (R;PT;In Portuguese)
**Cost**
Economics of low-level radioactive waste disposal, 9:1944 (R;US)
**Environmental Effects**
High-level waste disposal, 9:2013 (J;US)

Management of radwaste at Chalk River, Canada: storage and disposal, 9:2005 (J;US)
**Environmental Impacts**
A systems modeling approach to evaluating low-level waste disposal systems, 9:2008 (J;US)
Environmental effect of the barriers in the KBS disposal system, 9:2043 (RA;CA)
Long-term management of liquid high-level radioactive wastes stored at the Western New York Nuclear Service Center, West Valley, 9:2038 (J;US)
Utilizing existing technology to improve environmental protection, 9:2015 (J;US)
WIPP: the solution to disposal of defense transuranic waste, 9:2030 (J;US)
**Ethics**
Protecting future generations, 9:1968 (RA;CA)
**Geologic Deposits**
Application of oil exploration techniques toward finding a nuclear waste repository site, 9:2040 (J;US)
Preparing to license deep disposal facilities. The international scene, 9:1975 (RA;CA)
Summary of the Basalt Waste Isolation Project, 9:2016 (J;US)
**Heat Transfer**
Peak high-level waste package temperature versus annular air gap width, 9:2024 (J;US)
**High-Level Radioactive Wastes**
Actinide transmutation with a $UF_6$ reactor, 9:2026 (J;US)
Application of oil exploration techniques toward finding a nuclear waste repository site, 9:2040 (J;US)
Development of CT techniques for integrity evaluation of vitrified solids, 9:2023 (J;US)
High-level radioactive waste disposal in the ocean floor: an introduction, 9:2036 (J;US)
High-level waste disposal, 9:2013 (J;US)
Leach testing of INEL waste forms in a gamma field, 9:2022 (J;US)
Pacing and logistics of high-level waste disposal, 9:2025 (J;US)
Peak high-level waste package temperature versus annular air gap width, 9:2024 (J;US)
Radioactive waste disposal in the sea and alternative methods of ultimate disposal, 9:1979 (R;DE)
Waste packages for high-level waste repositories, 9:2014 (J;US)
**Intermediate-Level Radioactive Wastes**
Strategy for the disposal of low- and intermediate-level radwastes in Canada, 9:1972 (RA;CA)
**International Cooperation**
Canada's contribution towards international consensus on nuclear fuel waste disposal, 9:1976 (RA;CA)
Disposal safety. Is consensus necessary, 9:2049 (RA;CA)
Techniques and International Programs for Nuclear Waste Disposal Beneath the Ocean Floor, 9:1983 (R;FR)
**Liabilities**
Financial security and insurance for damage caused by use of the seabed for radioactive waste disposal, 9:1984 (R;FR;In French)
Sub-seabed burial of radioactive waste and liabilities, 9:1982 (R;FR;In French)
**Low-Level Radioactive Wastes**
A systems modeling approach to evaluating low-level waste disposal systems, 9:2008 (J;US)
Economics of low-level radioactive waste disposal, 9:1944 (R;US)
Identification of cost factors for the ocean disposal alternative for low-level radioactive waste, 9:1995 (R;US)
Low-level waste disposal technology, 9:2011 (J;US)
Management of radwaste at Chalk River, Canada: storage and disposal, 9:2005 (J;US)
Potential low-level waste disposal limits for fusion radionuclides, 9:2060 (R;US)
Radioactive waste disposal in the sea and alternative methods of ultimate disposal, 9:1979 (R;DE)
Radwaste characterization: key to an optimized waste management plan, 9:2007 (J;US)
Selecting host states for low-level waste-disposal sites, 9:1943 (R;US)
States' approach to low-level waste disposal, 9:2010 (J;US)
Strategy for the disposal of low- and intermediate-level radwastes in Canada, 9:1972 (RA;CA)
Survey of power plant LLW volume reduction and storage actions/plans, 9:2004 (J;US)
Utilizing existing technology to improve environmental protection, 9:2015 (J;US)
**Marine Disposal**
Financial security and insurance for damage caused by use of the seabed for radioactive waste disposal, 9:1984 (R;FR;In French)
High-level radioactive waste disposal in the ocean floor: an introduction, 9:2036 (J;US)
Identification of cost factors for the ocean disposal alternative for low-level radioactive waste, 9:1995 (R;US)
Radioactive waste disposal in the sea and alternative methods of ultimate disposal, 9:1979 (R;DE)
Scientific cooperation agreement on an investigation and surveillance programme on the site for radioactive waste disposal in the North-East Atlantic between the Nuclear Research Centre (CEN), Belgium and the National Laboratory of Industrial Engineering and Technology (LNETI), Portugal, 9:1985 (R;PT;In Portuguese)
**Mill Tailings**
Innovation required in the disposal of uranium mine wastes, 9:1969 (RA;CA)
**Packaging**
Waste packages for high-level waste repositories, 9:2014 (J;US)
**Pilot Plants**
WIPP: the solution to disposal of defense transuranic waste, 9:2030 (J;US)
**Planning**
Pacing and logistics of high-level waste disposal, 9:2025 (J;US)
**Program Management**
Regional low-level radioactive waste disposal sites: progress being made but new sites will probably not be ready by 1986, 9:2051 (R;US)
**Radionuclide Migration**
Effect of repository heating on dissolution of glass waste, 9:2019 (J;US)
Error analysis of nuclear waste migration, 9:2021 (J;US)
Mass transport from a waste emplaced in backfill and rock, 9:2017 (J;US)
Radionuclide migration in transport paths bounded by the environment, 9:2020 (J;US)
Solubility-limited transport of radionuclides through fractured rock, 9:2018 (J;US)
Summary of the Basalt Waste Isolation Project, 9:2016 (J;US)
**Research Programs**
Canada's contribution towards international consensus on nuclear fuel waste disposal, 9:1976 (RA;CA)
Techniques and International Programs for Nuclear Waste Disposal Beneath the Ocean Floor, 9:1983 (R;FR)
**Risk Assessment**
Use of the SYVAC computer code in assessing a nuclear fuel waste disposal concept, 9:1971 (RA;CA)
**Safety**
Disposal safety. Is consensus necessary, 9:2049 (RA;CA)
Environmental effect of the barriers in the KBS disposal system, 9:2043 (RA;CA)
Safety assessment of fuel water disposal appropriate to the German waste management programme, 9:1974 (RA;CA)
**Salt Deposits**
Peak high-level waste package temperature versus annular air gap width, 9:2024 (J;US)
Site evaluation for disposal facilities in salt, 9:1978 (R;DE)
**Sea Bed**
Sub-seabed burial of radioactive waste and liabilities, 9:1982 (R;FR;In French)
Techniques and International Programs for Nuclear Waste Disposal Beneath the Ocean Floor, 9:1983 (R;FR)
**Site Selection**
Application of oil exploration techniques toward finding a nuclear waste repository site, 9:2040 (J;US)
Nuclear Regulatory Commission programs, 9:2440 (RA;US)

Regional low-level radioactive waste disposal sites: progress being made but new sites will probably not be ready by 1986, 9:2051 (R;US)
Selecting host states for low-level waste-disposal sites, 9:1943 (R;US)
Site evaluation for disposal facilities in salt, 9:1978 (R;DE)
**Site Surveys**
WIPP: the solution to disposal of defense transuranic waste, 9:2030 (J;US)
**Technology Assessment**
A systems modeling approach to evaluating low-level waste disposal systems, 9:2008 (J;US)
Low-level waste disposal technology, 9:2011 (J;US)
Pacing and logistics of high-level waste disposal, 9:2025 (J;US)
**Temperature Gradients**
Peak high-level waste package temperature versus annular air gap width, 9:2024 (J;US)
**Underground Disposal**
Error analysis of nuclear waste migration, 9:2021 (J;US)
R and D program concerning radioactive waste disposal in deep geologic formation (Study of an argilaceous formation in Belgium). Summary of works carried out in the years 1975-1979, 9:1947 (R;XE;In French)
Safety assessment of fuel water disposal appropriate to the German waste management programme, 9:1974 (RA;CA)
**Waste-Rock Interactions**
Mass transport from a waste emplaced in backfill and rock, 9:2017 (J;US)
Radionuclide migration in transport paths bounded by the environment, 9:2020 (J;US)

**RADIOACTIVE WASTE FACILITIES**
**Biological Shields**
Shield integrity examinations at the NWCF, 9:2048 (RA;CA)
**Design**
Summary of the Basalt Waste Isolation Project, 9:2016 (J;US)
**Environmental Effects**
Ecological vectors of radionuclide transport at a solid radioactive waste disposal facility in southeastern Idaho, 9:3289 (RA;US)
**Personnel**
Projected occupational exposures during WIPP operations, 9:2002 (J;US)
**Radiation Protection**
Projected occupational exposures during WIPP operations, 9:2002 (J;US)
**Radioecology**
Ecological vectors of radionuclide transport at a solid radioactive waste disposal facility in southeastern Idaho, 9:3289 (RA;US)
Ecology of carrion beetles (Nicrophorus spp.) at a solid radioactive waste disposal area, 9:3293 (RA;US)
Importance of biota in radionuclide transport at the SL-1 radioactive waste disposal area, 9:3292 (RA;US)
Population ecology of small mammals on the radioactive waste management complex, Idaho National Engineering Laboratory, 9:3290 (RA;US)
Preliminary report of biological intrusion studies at the Idaho National Engineering Laboratory subsurface disposal area, 9:1941 (RA;US)
Rodent movements, densities and radionuclide concentrations at a liquid radioactive waste disposal area, 9:3294 (RA;US)
Small mammal density and movement on the SL-1 disposal area, Idaho National Engineering Laboratory, 9:3291 (RA;US)
**Radionuclide Migration**
Black-tailed jack rabbit movements and habitat utilization at the Idaho National Engineering Laboratory radioactive waste management complex, 9:3295 (RA;US)
**Research Programs**
Project progress report for month ending September 30, 1983, 9:2001 (R;US)
**Site Selection**
Public hearings panel report: a summary of public concerns regarding the characterization of a repository site in Nevada (Yucca Mountain), 9:1987 (R;US)

**RADIOACTIVE WASTE MANAGEMENT**
Simulated HLLW compositions for cold test of waste management development, 9:1986 (R;JP)
The effect of accidents on decommissioning waste management for nuclear fuel cycle and nonfuel cycle facilities, 9:2306 (J;US)
**Alpha-Bearing Wastes**
Policy directions: Department of Energy transuranic waste management programs, 9:2027 (J;US)
The certification program of transuranic wastes at INEL, 9:2032 (J;US)
Transuranic waste management: technology status and needs, 9:2031 (J;US)
**Government Policies**
Policy directions: Department of Energy transuranic waste management programs, 9:2027 (J;US)
**Low-Level Radioactive Wastes**
Concentrations of selected short-lived isotopes in a low-level waste inventory, 9:2009 (J;US)
Radwaste characterization: key to an optimized waste management plan, 9:2007 (J;US)
Regional compacting for low-level radioactive waste management: an innovative approach, 9:2003 (J;US)
States' approach to low-level waste disposal, 9:2010 (J;US)
Survey of power plant LLW volume reduction and storage actions/plans, 9:2004 (J;US)
**Meetings**
Waste management in nuclear facilities. Abstracts, 9:2041 (B;DE)
**Research Programs**
Nuclear waste management, 9:1993 (RA;US)
**Safeguard Regulations**
Transuranic waste management: technology status and needs, 9:2031 (J;US)
**Technology Assessment**
Transuranic waste management: technology status and needs, 9:2031 (J;US)
**Technology Transfer**
A technology implementation perspective on defense transuranic waste management, 9:2028 (J;US)
**Technology Utilization**
The U.S. DOE commercial waste disposal programs, 9:2037 (J;US)

**RADIOACTIVE WASTE PROCESSING**
*See also SYNROC PROCESS*
Ion exchange mechanism of cesium removal by cyanoferrates, 9:2042 (B;GB)
**Alpha-Bearing Wastes**
A technology implementation perspective on defense transuranic waste management, 9:2028 (J;US)
Commercial waste treatment technology and programs, 9:2012 (J;US)
Concreting of incinerated simulated TRU wastes, 9:2034 (J;US)
In-situ vitrification of transuranic wastes: systems evaluation and applications assessment, 9:1998 (R;US)
In-situ vitrification of transuranic wastes: systems evaluation and applications assessment, 9:1996 (R;US)
Status, direction, and critical issues of waste treatment technology, 9:1997 (R;US)
**Anaerobic Digestion**
Biotechnology and environmental programs, 9:3388 (RA;US)
**Carbon 14**
Nuclear waste management, 9:1993 (RA;US)
**Combustion**
Concreting of incinerated simulated TRU wastes, 9:2034 (J;US)
Design and operational experience with the off-gas cleaning system of the Seibersdorf incinerator plant, 9:1953 (RA;XA)
High temperature incineration. Densification of granules from high temperature incineration. Incineration of solid wastes contaminated with plutonium, 9:1949 (R;XE)
Radwaste incineration at CRNL, 9:1965 (RA;CA)
Status, direction, and critical issues of waste treatment technology, 9:1997 (R;US)
Treatment of Pu-containing waste by acid digestion (wet combustion), 9:1977 (R;DE)

**Compacting**
Survey of power plant LLW volume reduction and storage actions/plans, 9:2004 (J;US)
**Electrochemistry**
Electrical processes for the treatment of medium-active liquid wastes. Annual progress report, January-December 1982, 9:1939 (R;GB)
**Encapsulation**
Processing of irradiated fuel cans by rolling and embedding in concrete (Final report Nov 1976-Jul 1980), 9:1950 (R;XE;In German)
**Financial Incentives**
Commercial waste treatment technology and programs, 9:2012 (J;US)
**Gaseous Wastes**
Seminar on the testing and operation of off-gas cleaning systems at nuclear facilities, Karlsruhe, Germany, F.R., 3-7 May 1982, 9:1956 (R;XA)
**High-Level Radioactive Wastes**
Commercial waste treatment technology and programs, 9:2012 (J;US)
Development of a batch process for immobilizing some CRNL radioactive waste in glass, 9:1963 (RA;CA)
Nuclear waste management, 9:1993 (RA;US)
Status, direction, and critical issues of waste treatment technology, 9:1997 (R;US)
**Intermediate-Level Radioactive Wastes**
Bituminization of nuclear wastes. Development, design and demonstration, 9:1967 (RA;CA)
**Iodine 129**
Photochemical abatement of radioactive iodines, 9:1964 (RA;CA)
**Iodine 131**
Photochemical abatement of radioactive iodines, 9:1964 (RA;CA)
**Leaching**
Acid digestion of Pu-containing waste. Process development and Pu-recovery, 9:1945 (R;XE;In German)
**Liquid Wastes**
Treatment of radioactive liquid wastes at the Loviisa nuclear power station, Finland, 9:2006 (J;US)
**Low-Level Radioactive Wastes**
Bituminization of nuclear wastes. Development, design and demonstration, 9:1967 (RA;CA)
Commercial waste treatment technology and programs, 9:2012 (J;US)
Radwaste incineration at CRNL, 9:1965 (RA;CA)
Reverse osmosis plant to process CRNL low-level radioactive liquid wastes, 9:1966 (RA;CA)
Status, direction, and critical issues of waste treatment technology, 9:1997 (R;US)
Survey of power plant LLW volume reduction and storage actions/plans, 9:2004 (J;US)
Treatment of radioactive liquid wastes at the Loviisa nuclear power station, Finland, 9:2006 (J;US)
Utilizing existing technology to improve environmental protection, 9:2015 (J;US)
**Meetings**
Seminar on the testing and operation of off-gas cleaning systems at nuclear facilities, Karlsruhe, Germany, F.R., 3-7 May 1982, 9:1956 (R;XA)
**Osmosis**
Reverse osmosis plant to process CRNL low-level radioactive liquid wastes, 9:1966 (RA;CA)
**Pilot Plants**
Development of a batch process for immobilizing some CRNL radioactive waste in glass, 9:1963 (RA;CA)
**Plutonium**
Treatment of Pu-containing waste by acid digestion (wet combustion), 9:1977 (R;DE)
**Radioactive Effluents**
Tritium handling requirements and development for fusion, 9:4159 (RA;XA)
**Solidification**
Bituminization of nuclear wastes. Development, design and demonstration, 9:1967 (RA;CA)
Concreting of incinerated simulated TRU wastes, 9:2034 (J;US)
Development of a batch process for immobilizing some CRNL radioactive waste in glass, 9:1963 (RA;CA)
Handling and storage of high-level liquid wastes from reprocessing of spent fuel, 9:1961 (R;DE)
Radiation damage in nuclear waste ceramics, 9:2788 (J;US)
Solidification of alpha-bearing wastes in ceramic, 9:1948 (R;XE;In German)
Treatment of concentrated waste for storage - fixation of concentrated gaseous waste, 9:1957 (R;DE)
Treatment of concentrated waste for storage and disposal, 9:1980 (R;DE)
Utilizing existing technology to improve environmental protection, 9:2015 (J;US)
**Standards**
American National Standard: liquid radioactive-waste-processing system for light-water-reactor plants, 9:2345 (B;US)
**Technology Assessment**
Commercial waste treatment technology and programs, 9:2012 (J;US)
**Vitrification**
Fabrication of high activity glasses in the cells VULCAIN and PIVER. Leaching at three temperatures of some of these glasses in the VULCAIN cell, 9:1946 (R;XE;In French)
In-situ vitrification of transuranic wastes: systems evaluation and applications assessment, 9:1998 (R;US)
In-situ vitrification of transuranic wastes: systems evaluation and applications assessment, 9:1996 (R;US)
Status, direction, and critical issues of waste treatment technology, 9:1997 (R;US)

**RADIOACTIVE WASTE STORAGE**
**Coverings**
Preliminary report of biological intrusion studies at the Idaho National Engineering Laboratory subsurface disposal area, 9:1941 (RA;US)
**Leaks**
Preliminary report of biological intrusion studies at the Idaho National Engineering Laboratory subsurface disposal area, 9:1941 (RA;US)
**Liquid Wastes**
Treatment of radioactive liquid wastes at the Loviisa nuclear power station, Finland, 9:2006 (J;US)
**Low-Level Radioactive Wastes**
Application of conventional building technology in the storage of low level solid reactor wastes, 9:1973 (RA;CA)

Kinetic features of an intraresin reaction, 9:2989 (J;US)
**Photochemistry**
Radiation curing of inks and coatings. Annual report 1 Oct 81-30 Sep 82, 9:3027 (R;US)

**RESONANCE CAVITIES**
*See CAVITY RESONATORS*

**RESONATORS**
*See also CAVITY RESONATORS*

**Physical Radiation Effects**
Modification of point defects in quartz for device applications, 9:2829 (R;US)
**RESOURCE RECOVERY FACILITIES**
**Feasibility Studies**
Resource Recovery Co-Disposal Demonstration Project, Middlesex County, New Jersey: feasibility study and recommendation for implementation. Final report, 9:2655 (R;US)
**RESPIRABLE DUSTS**
*See DUSTS*
**RESPIRATORY SYSTEM DISEASES**
**Epidemiology**
Respiratory effects of air pollutants, 9:3410 (R;SE;In Swedish)
**RETROFITTING**
**Baseline Ecology**
Environmental assessment: conversion to coal Sierra Pacific Power Company, Ft. Churchill Generating Station, units 1 and 2, Wabuska, Lyon County, Nevada, 9:2185 (R;US)
**Environmental Effects**
Environmental assessment: conversion to coal Sierra Pacific Power Company, Ft. Churchill Generating Station, units 1 and 2, Wabuska, Lyon County, Nevada, 9:2185 (R;US)
**REVERSE-FIELD PINCH**
**Magnetic Field Reversal**
Sustained self-reversal in the reversed field pinch, 9:4150 (R;US)
**Magnetohydrodynamics**
Reversed field pinch dynamics and transport studies. Quarterly progress report, 20 July 1983-20 October 1983, 9:4043 (R;US)
**Plasma Confinement**
Experimental studies of field-reversed configuration confinement in FRX-C, 9:4131 (BA;XA)
**Plasma Diagnostics**
Soft X-ray imaging diagnostic on the HBTX 1A reversed field pinch, 9:4035 (R;GB)
**Transport Theory**
Reversed field pinch dynamics and transport studies. Quarterly progress report, 20 July 1983-20 October 1983, 9:4043 (R;US)
**RHEINSBERG AKW1 REACTOR**
**Neutron Flux**
Evaluation of neutron flux density and power density with SPN-detectors and micro calorimeters. A comparison, 9:2207 (R;DD)
**Self-Powered Neutron Detectors**
Evaluation of neutron flux density and power density with SPN-detectors and micro calorimeters. A comparison, 9:2207 (R;DD)
**RHENIUM**
**Solvent Extraction**
Basic science and technology, 9:1928 (RA;US)
**RHENIUM COMPLEXES**
**Chemical Preparation**
Synthesis and chemistry of chiral vinyl rhenium complexes (eta-$C_5H_5$)Re(NO)($PPh_3$)(CH==CHR). Stereoselective reactions with electrophiles and a spontaneous alkylidene to olefin rearrangement, 9:2924 (J;US)
**Stereochemistry**
Synthesis and chemistry of chiral vinyl rhenium complexes (eta-$C_5H_5$)Re(NO)($PPh_3$)(CH==CHR). Stereoselective reactions with electrophiles and a spontaneous alkylidene to olefin rearrangement, 9:2924 (J;US)
**Structural Chemical Analysis**
Synthesis and chemistry of chiral vinyl rhenium complexes (eta-$C_5H_5$)Re(NO)($PPh_3$)(CH==CHR). Stereoselective reactions with electrophiles and a spontaneous alkylidene to olefin rearrangement, 9:2924 (J;US)
**RHODIUM**
**Absorption Spectroscopy**
Application of the inductively coupled plasma system to the simultaneous determination of precious metals, 9:2893 (R;ZA)
**Coatings**
Electronic structure of metal overlayers on rhodium, 9:2718 (J;US)
**Electronic Structure**
Electronic structure of metal overlayers on rhodium, 9:2718 (J;US)
**Self-Diffusion**
Theoretical studies of surface diffusion: Self-diffusion in the fcc(100) system, 9:2726 (J;US)
**Spectrophotometry**
Application of the inductively coupled plasma system to the simultaneous determination of precious metals, 9:2893 (R;ZA)
**Surface Properties**
Theoretical studies of surface diffusion: Self-diffusion in the fcc(100) system, 9:2726 (J;US)
**RHODIUM 106**
**Uptake**
In situ responses of a biological indicator Mytilus edulis L. to the variations of radionuclide discharges from a fuel reprocessing plant, 9:3286 (R;FR;In French)
**RHODIUM BORIDES**
**Critical Field**
Unusual critical-field behavior in Y/sub 1-x/Er/sub x/$Rh_4B_4$, 9:2783 (J;US)
**Superconductivity**
Unusual critical-field behavior in Y/sub 1-x/Er/sub x/$Rh_4B_4$, 9:2783 (J;US)
**RHODIUM COMPLEXES**
**Catalytic Effects**
Coordinately unsaturated clusters. A novel catalytic reaction, 9:2982 (J;US)
**RICE**
**Biological Radiation Effects**
Study of radio-restoration by various mineral salts and silica rich products (Tuf and Pouzzolane) of rice embryos (Oryza-sativa L, Cigalon variety) exposed to cobalt 60 gamma rays, 9:3387 (R;FR;In French)
**RICHLAND FFTF REACTOR**
*See FFTF REACTOR*
**RIEMANN WAVES**
*See SHOCK WAVES*
**RING LASERS**
**Design**
Combination ring cavity and backward raman waveguide amplifier, 9:3080 (P;US)
**Waveguides**
Combination ring cavity and backward raman waveguide amplifier, 9:3080 (P;US)
**RINGOTRON**
*See ELECTRON-RING ACCELERATORS*
**RINGS (STORAGE)**

**RISK ASSESSMENT**
Interim results of the accident sequence evaluation program (ASEP) (PWR; BWR), 9:2451 (R;US)
Organization for the performance of PRA programs, 9:2488 (BA;US)
Reactor safety. Some current realities, 9:2423 (RA;CA)
Realistic estimates of the consequences of nuclear accidents, 9:2424 (RA;CA)
**Computerized Simulation**
Variance reduction in simulation, 9:2486 (BA;US)
**Human Factors**
IREP human reliability analysis, 9:2495 (BA;US)
**Mathematical Models**
Variance reduction in simulation, 9:2486 (BA;US)
**ROAD TESTS**
**Fuel Consumption**
Fuel and tyre costs and driving comfort on the surface dressing, 9:2636 (R;FI;In Finnish)
**ROCKS**
**Fractures**
Investigation of equivalent porous medium permeability in networks of discontinuous fractures, 9:3436 (R;US)

**Permeability**
Investigation of equivalent porous medium permeability in networks of discontinuous fractures, 9:3436 (R;US)

**ROD BUNDLES**
**Two-Phase Flow**
Detection of flow mixing processes using transmission methods in high-duty heat exchanging apparatus. Final report for the sub-project E6, 9:3082 (R;DE;In German)

**RODENTS**
*See also RATS*
**Behavior**
Preliminary report of biological intrusion studies at the Idaho National Engineering Laboratory subsurface disposal area, 9:1941 (RA;US)
Rodent movements, densities and radionuclide concentrations at a liquid radioactive waste disposal area, 9:3294 (RA;US)
**Contamination**
Rodent movements, densities and radionuclide concentrations at a liquid radioactive waste disposal area, 9:3294 (RA;US)
**Ecology**
Effects of a controlled fire on small rodent populations in a sagebrush community, 9:3308 (RA;US)
**Population Density**
Long-term studies of relative density of rodents on the Idaho National Engineering Laboratory, 9:3316 (RA;US)
Population ecology of small mammals on the radioactive waste management complex, Idaho National Engineering Laboratory, 9:3290 (RA;US)
Relative abundance of coyotes, lagomorphs, and rodents on the Idaho National Engineering Laboratory, 9:3314 (RA;US)
Rodent movements, densities and radionuclide concentrations at a liquid radioactive waste disposal area, 9:3294 (RA;US)
**Population Dynamics**
Small mammal density and movement on the SL-1 disposal area, Idaho National Engineering Laboratory, 9:3291 (RA;US)
**Predator-Prey Interactions**
Relative abundance of coyotes, lagomorphs, and rodents on the Idaho National Engineering Laboratory, 9:3314 (RA;US)
**Radiation Doses**
Ecological vectors of radionuclide transport at a solid radioactive waste disposal facility in southeastern Idaho, 9:3289 (RA;US)

**RODS (CONTROL)**
*See CONTROL ELEMENTS*

**RODS (FUEL)**
*See FUEL RODS*

**ROUGHNESS**
**Diffraction**
An estimate of the surface roughness effect, 9:3992 (J;DK)

**RUBBERS**
**Energy Losses**
Viscoelastic loss characteristics of cord rubber composites, 9:2802 (R;US)

**RUBIDIUM**
**Neutron Reactions**
Estimation of neutron-induced spallation yields of krypton isotopes, 9:3896 (J;US)
**Proton Reactions**
Estimation of neutron-induced spallation yields of krypton isotopes, 9:3896 (J;US)

**RUBIDIUM 95**
**Delayed Neutrons**
Studies of neutron resonances in far-unstable nuclides via beta-delayed neutron energy spectra, 9:3899 (R;US)

**RUBIDIUM 97**
**Delayed Neutrons**
Studies of neutron resonances in far-unstable nuclides via beta-delayed neutron energy spectra, 9:3899 (R;US)

**RUBIDIUM CARBIDES**
**Neutron Diffraction**
Neutron spectroscopy of phonons in stage-1 rubidium-intercalated graphite, 9:2779 (J;US)
**Phonons**
Neutron spectroscopy of phonons in stage-1 rubidium-intercalated graphite, 9:2779 (J;US)

**RUBIDIUM IONS**
**Energy Levels**
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)
**Oscillator Strengths**
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)

**RUBIDIUM ISOTOPES**
*See also RUBIDIUM 95*
*RUBIDIUM 97*
**Delayed Neutron Precursors**
Delayed neutron precursors at masses 97—99 and 146—148, 9:3910 (J;US)

**RUBY**
**Sorptive Properties**
Electron correlation and hole localization in photon-stimulated ion desorption from solid $N_2$, CO, and $C_2H_2$, 9:2930 (J;US)

**RUSSELLVILLE-1 ARKANSAS REACTOR**
*See ARKANSAS-1 REACTOR*

**RUSSELLVILLE-2 ARKANSAS REACTOR**
*See ARKANSAS-2 REACTOR*

**RUTHENIUM**
**Absorption Spectra**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)
**Absorption Spectroscopy**
Application of the inductively coupled plasma system to the simultaneous determination of precious metals, 9:2893 (R;ZA)
**Catalytic Effects**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)
**Chemical Preparation**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)
**Infrared Spectra**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)
**Sorptive Properties**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)
**Spectrophotometry**
Application of the inductively coupled plasma system to the simultaneous determination of precious metals, 9:2893 (R;ZA)

**RUTHENIUM 106**
**Uptake**
In situ responses of a biological indicator Mytilus edulis L. to the variations of radionuclide discharges from a fuel reprocessing plant, 9:3286 (R;FR;In French)

**RUTHENIUM CHLORIDES**
**Adsorption**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)
**Decomposition**
Effect of preparation methods on the catalytic properties of zeolite-supported ruthenium in the Fischer-Tropsch synthesis, 9:2081 (J;US)

**RUTHENIUM COMPLEXES**
**Absorption Spectra**
Aspects of artificial photosynthesis. Photosensitized electron transfer and charge separation in redox active surfactant aggregates, 9:3010 (J;US)
**Electron Transfer**
Aspects of artificial photosynthesis. Photosensitized electron transfer and charge separation in redox active surfactant aggregates, 9:3010 (J;US)

**PH Value**
Bronsted acidities of carbonyl hydride complexes of iron, ruthenium, and osmium: pK/sub a/ values and deprotonation rates in methanol solution, 9:2955 (J;US)
**Photochemical Reactions**
Aspects of artificial photosynthesis. Photosensitized electron transfer and charge separation in redox active surfactant aggregates, 9:3010 (J;US)
Characterization and photochemistry of surface-confined mononuclear and trinuclear phosphine/carbonyl complexes of ruthenium(0). Interim technical report, 9:2997 (R;US)
Synthesis, structure, and photochemistry of tetracarbonyl(fulvalene)diruthenium. Thermally reversible photoisomerization involving carbon-carbon bond activation at a dimetal center, 9:3015 (J;US)
**Structural Chemical Analysis**
Synthesis, structure, and photochemistry of tetracarbonyl(fulvalene)diruthenium. Thermally reversible photoisomerization involving carbon-carbon bond activation at a dimetal center, 9:3015 (J;US)

**RUTHENIUM OXIDES**
**Adsorption**
Volatilization and trapping of ruthenium during calcination of nitric acid solutions, 9:1954 (RA;XA)

**RUTHERFORD SCATTERING**
**Optical Theorem**
Optical theorem and forward glory effects in heavy-ion scattering, 9:3942 (R;BR)

**Response Modifying Factors**
Study of radio-restoration by various mineral salts and silica rich products (Tuf and Pouzzolane) of rice embryos (Oryza-sativa L, Cigalon variety) exposed to cobalt 60 gamma rays, 9:3387 (R;FR;In French)

**SILICIC ACID**
**Interatomic Forces**
Ab initio calculation of interatomic force constants in $H_6Si_2O_7$ and the bulk modulus of α quartz and α cristobalite, 9:2880 (J;DE)

**SILICON**
**Annealing**
Flash lamp annealing of ion implanted boron profiles, 9:2826 (R;AT;In German)
Rapid thermal annealing of arsenic and boron-implanted silicon, 9:2834 (J;US)
Time-resolved conductance and reflectance measurements of silicon during pulsed-laser annealing, 9:2868 (J;US)
**Casting**
Part 1: Silicon ingot casting. Heat Exchanger Method (HEM), 9:2111 (R;US)
**Charged-Particle Transport**
Distributions of accelerated ion ranges. Helium and lithium isotopes, 9:3961 (R;SU;In Russian)
Phenomenon of the minimum of radiation energy losses of relativistic electrons in the crystal, 9:3959 (R;SU;In Russian)
**Chemical Bonds**
Strain-induced localization and electronically stimulated desorption and dissociation, 9:2840 (J;US)
**Crystal Defects**
Diffuse x-ray scattering for the study of defects in silicon, 9:2878 (BA;NL)
**Crystal Doping**
Silicon doping with a new ion implementation method with a pulsed annealing. Solar cells applications, 9:2100 (R;FR;In French)
**Crystal Growth**
Origin of SiC impurities in silicon crystals grown from the melt in vacuums, 9:2115 (R;US)
Part 1: Silicon ingot casting. Heat Exchanger Method (HEM), 9:2111 (R;US)
Proceedings of the Flat-Plate Solar Array Workshop on the Science of Silicon Material Preparation, 9:2117 (R;US)
Silicon crystal growth in vacuum, 9:2114 (R;US)
Single crystal growth of upgraded metallurgical silicon by HEM for photovoltaic applications, 9:2116 (R;US)
**Cutting**
Part 2: Multi-wire slicing. Fixed Abrasive Slicing Technique (FAST), 9:2112 (R;US)
Silicon slicing by fixed abrasive slicing technique, 9:2113 (R;US)
**Dendritic Web Growth Method**
Apparatus for growing a dendritic web, 9:2861 (P;US)
**Deposition**
Proceedings of the Flat-Plate Solar Array Workshop on the Science of Silicon Material Preparation, 9:2117 (R;US)
Substrate temperature dependence of microcrystallinity in plasma-deposited, boron-doped hydrogenated silicon alloys, 9:2831 (J;US)
**Electric Conductivity**
Substrate temperature dependence of microcrystallinity in plasma-deposited, boron-doped hydrogenated silicon alloys, 9:2831 (J;US)
Time-resolved conductance and reflectance measurements of silicon during pulsed-laser annealing, 9:2868 (J;US)
**Erosion**
Velocity and size dependences of the erosion rate in silicon, 9:2877 (J;NL)
**Impurities**
Origin of SiC impurities in silicon crystals grown from the melt in vacuums, 9:2115 (R;US)
Single crystal growth of upgraded metallurgical silicon by HEM for photovoltaic applications, 9:2116 (R;US)
**Ion Implantation**
Flash lamp annealing of ion implanted boron profiles, 9:2826 (R;AT;In German)
Rapid thermal annealing of arsenic and boron-implanted silicon, 9:2834 (J;US)
Silicon doping with a new ion implementation method with a pulsed annealing. Solar cells applications, 9:2100 (R;FR;In French)
**Meetings**
Proceedings of the Flat-Plate Solar Array Workshop on the Science of Silicon Material Preparation, 9:2117 (R;US)
**Melting**
Melting phenomenon and properties of defects associated with pulsed laser irradiation, 9:2876 (J;GB)
**Order-Disorder Transformations**
Substrate temperature dependence of microcrystallinity in plasma-deposited, boron-doped hydrogenated silicon alloys, 9:2831 (J;US)
**Phase Transformations**
Experiments with phase transitions at very high pressure. Final Report, 9:2825 (R;US)
**Positron Channeling**
Some specific features of coherent radiation and particle propagation in crystals, 9:2823 (R;SU;In Russian)
**Raman Spectra**
Importance of temperature-dependent optical properties for Raman-temperature measurements for silicon, 9:2849 (J;US)
**Reflectivity**
Time-resolved conductance and reflectance measurements of silicon during pulsed-laser annealing, 9:2868 (J;US)
**Sorptive Properties**
Hydrogen chemisorption on silicon (100) 2 x 1, 9:2759 (J;NL)
**Sputtering**
Reactive sputtering of amorphous silicon in Ne, Ar, and Kr, 9:2844 (J;US)
**Strains**
Strain-induced localization and electronically stimulated desorption and dissociation, 9:2840 (J;US)
**Traps**
Effects of light and modulation frequency on spin-dependent trapping at silicon grain boundaries, 9:2828 (R;US)
**Vacuum Casting**
Silicon crystal growth in vacuum, 9:2114 (R;US)
**Vapor Deposited Coatings**
Structural properties of titanium dioxide films deposited in an rf glow discharge, 9:2777 (J;US)

**SILICON 28**

Genesis and emplacement of oil in the San Andres Formation, Northern Shelf of the Midland Basin, Texas. Report of Investigations No. 116, 9:1814 (R;US)

**Stratigraphy**
Genesis and emplacement of oil in the San Andres Formation, Northern Shelf of the Midland Basin, Texas. Report of Investigations No. 116, 9:1814 (R;US)

**TEXTOR TOKAMAK**

**Electric Grounds**
Grounding system of TEXTOR, 9:4228 (BA;GB)

**Power Supplies**
Interactions between the line-connected static convertors of TEXTOR, 9:4227 (BA;GB)
**TFR TOKAMAK**
**ECR Heating**
Computation code for the energy deposition calculation of a resonant wave near the electron cyclotron frequency, 9:4049 (R;FR;In French)
**TFTR REACTORS**
**Construction**
Status of TFTR construction and proposed research plan, 9:4202 (BA;XA)
**Planning**
Status of TFTR construction and proposed research plan, 9:4202 (BA;XA)
**Tearing Instability**
Thermal consequences of plasma disruptions in TFTR and ETF, 9:4140 (BA;GB)
**THALLIUM ISOTOPES**
**Beta Decay**
Nuclear structure from radioactive decay. Annual progress report, 9:3916 (R;US)
**Energy Levels**
Nuclear structure from radioactive decay. Annual progress report, 9:3916 (R;US)
**THALLIUM NITRATES**
**Chemical Reactions**
Instrumental methods of analysis of sulfur compounds in synfuel process streams. Quarterly technical progress report, July-September 1983, 9:1785 (R;US)
**THALLIUM SULFIDES**
**Phase Transformations**
Soft acoustic mode in thallium arsenic sulphide $Tl_3AsS_4$, 9:2873 (J;GB)
**THE GEYSERS**
*See GEYSERS GEOTHERMAL FIELD*
**THERMAL BARRIERS**
**Performance**
Control of gas input and background pressure in the end plug regions of the TMX-U thermal barrier experiment, 9:4192 (R;US)
**THERMAL CONDUCTIVITY**
**Measuring Instruments**
Improvement in the design and extension of operating range of viscometers and thermal conductivity cells. Annual technical progress report, 9:3203 (R;US)
**Measuring Methods**
Automated 2-D thermal model to predict temperatures in the material stack of a thermal comparator test device, 9:3095 (R;US)
**Regulations**
Thermal insulation ordinance and utilization of solar energy, 9:2595 (RA;DE;In German)
**THERMAL DECOMPOSITION**
*See PYROLYSIS*
**THERMAL EFFLUENTS**
**Biological Effects**
Impact of thermal loading and other water quality parameters on the epizootiology of Aeromonas hydrophila infections of centrarchids. Final report, 9:3402 (R;US)
**THERMAL ENERGY STORAGE EQUIPMENT**
**Specifications**
Molten salt thermal energy storage subsystem for solar thermal central receiver plants, 9:2146 (R;US)
**THERMAL INSULATION**
**Regulations**
Thermal insulation ordinance and utilization of solar energy, 9:2595 (RA;DE;In German)
**Thermal Conductivity**
Automated 2-D thermal model to predict temperatures in the material stack of a thermal comparator test device, 9:3095 (R;US)
**THERMAL PHOTOGRAPHY**

*I-BEAM TYPE REACTORS*
*LASER FUSION REACTORS*
*PULSED FUSION REACTORS*
*TOKAMAK TYPE REACTORS*
**Breeding Blankets**
First wall and blanket engineering development for magnetic fusion reactors, 9:4213 (BA;XA)
**Design**
Fusion reactor design-III. Report on the third IAEA technical committee meeting and workshop, Tokyo, Japan, 5-16 October 1981, 9:4199 (BA;XA)
**First Wall**
Cyclic thermal stresses in fusion reactors, 9:4215 (BA;XA)
First wall and blanket engineering development for magnetic fusion reactors, 9:4213 (BA;XA)
Progress in engineering simulation testing of fusion reactor first wall components, 9:4214 (BA;XA)
**Fuel Cycle**
Advanced fuel concepts and applications, 9:4212 (BA;XA)
**International Cooperation**
Fusion reactor design-III. Report on the third IAEA technical committee meeting and workshop, Tokyo, Japan, 5-16 October 1981, 9:4199 (BA;XA)
**Magnet Coils**
Near-term tokamak reactor designs with high performance resistive magnets, 9:4201 (BA;XA)
**Maintenance**
Issues in radioactivity for fusion energy: remote maintenance rating, 9:4191 (R;US)
**National Energy Plan**
Status of DOE's implementation of the Magnetic Fusion Energy Engineering Act of 1980, 9:4153 (R;US)
**Radioactive Waste Disposal**
Potential low-level waste disposal limits for fusion radionuclides, 9:2060 (R;US)
**Reactor Safety**
Fusion safety and protection issues: Lessons from fast breeder reactors and reprocessing plant studies, 9:4163 (RA;XA)
Past IAEA activities in the area of fusion safety. A brief overview, 9:4158 (RA;XA)
Safety methodology and risk targets, 9:4161 (RA;XA)
**Reverse-Field Pinch**
Recent studies of reversed-field pinch reactors, 9:4206 (BA;XA)
**Superconducting Magnets**
Superconducting magnet safety, 9:4162 (RA;XA)

**THERMONUCLEAR WEAPONS**
*See NUCLEAR WEAPONS*

**THIN FILMS**
**Fabrication**
Integrated thin film solar cell generators with higher output voltages, 9:2103 (R;XE)
**Growth**
Characterization of the substrate surface, nucleation and initial growth in the thin film formation, 9:3512 (RA;BR;In Portuguese)
**Nonlinear Problems**
Nonlinear saturation of Rayleigh—Taylor instability in thin films, 9:3985 (J;US)
**Nucleation**
Characterization of the substrate surface, nucleation and initial growth in the thin film formation, 9:3512 (RA;BR;In Portuguese)
**Rayleigh-Taylor Instability**
Nonlinear saturation of Rayleigh—Taylor instability in thin films, 9:3985 (J;US)
**Surface Properties**
Characterization of the substrate surface, nucleation and initial growth in the thin film formation, 9:3512 (RA;BR;In Portuguese)
**X-Ray Emission Analysis**
Surface studies with muons, 9:2890 (RA;US)

**THIO COMPOUNDS**
*See ORGANIC SULFUR COMPOUNDS*

**THIOETHERS**

**TIN**
**Carbon 12 Reactions**
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
**Compton Effect**
Compton scattering at bound electrons of copper, lead and tin at the primary photon energy Esub(y1)=661,66 keV and the scattering angle THETA=145°, 9:2700 (R;DE;In German)
**Diffusion**
Characterization of thin $Nb_3Sn$ diffusion layers on Nb(110): Low-energy electron-diffraction and photoemission studies, 9:2716 (J;US)
Diffusion assisted by radiation as a surface protection method, 9:2694 (RA;BR;In Portuguese)
**Ecological Concentration**
Trace element concentrations in different trophic levels near the site of a future coal-fired power plant and related facilities, 9:3282 (RA;US)
**Electron Diffraction**
Characterization of thin $Nb_3Sn$ diffusion layers on Nb(110): Low-energy electron-diffraction and photoemission studies, 9:2716 (J;US)
**Electronic Structure**
Characterization of thin $Nb_3Sn$ diffusion layers on Nb(110): Low-energy electron-diffraction and photoemission studies, 9:2716 (J;US)
**Ion Implantation**
Modification of the iron mechanical- and corrosion features by ion implantation in surface, 9:2691 (RA;BR;In Portuguese)
**Iron 56 Reactions**
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
**Oxidation**
Modification of the iron mechanical- and corrosion features by ion implantation in surface, 9:2691 (RA;BR;In Portuguese)
**Oxygen 16 Reactions**
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
**Oxygen 18 Reactions**
Factorization of fragment-production cross sections in relativistic heavy-ion collisions, 9:3877 (J;US)
**Photoelectron Spectroscopy**
Characterization of thin $Nb_3Sn$ diffusion layers on Nb(110): Low-energy electron-diffraction and photoemission studies, 9:2716 (J;US)
**X-Ray Fluorescence Analysis**
Determination, by X-ray-fluorescence spectrometry, of tin and tungsten in ores, concentrates, and residues of scheelite, wolframite, and cassiterite, 9:2891 (R;ZA)

**TIN 118**
**Giant Resonance**
Excitation of the isoscalar giant quadrupole resonance in $^{118}Sn(\pi^{+-},\pi^{+-\prime})$, 9:3911 (J;US)

**TIN 118 TARGET**
**Pion Minus Reactions**
Excitation of the isoscalar giant quadrupole resonance in $^{118}Sn(\pi^{+-},\pi^{+-\prime})$, 9:3911 (J;US)
**Pion Plus Reactions**
Excitation of the isoscalar giant quadrupole resonance in $^{118}Sn(\pi^{+-},\pi^{+-\prime})$, 9:3911 (J;US)

**TIN 120 TARGET**
**Pion Minus Reactions**
Dependence of the excitation energy, width, and cross section of the isovector monopole resonance, 9:3908 (R;US)
**Pion Plus Reactions**
Isobaric analog states in pion single-charge-exchange reactions on and above the (3,3) resonance energy, 9:3875 (J;US)

**TIN ALLOYS**

Wills Plasma Physics Department annual progress report 1982, 9:4056 (R;AU)
**Hydromagnetic Waves**
Wills Plasma Physics Department annual progress report 1982, 9:4056 (R;AU)
**Ion Temperature**
Design and construction of a $D_2O$ oscillator with optical pumping to measure the ion temperature of a plasma by Thomson scattering, 9:4051 (R;FR;In French)
**Limiters**
TRAIL - a tokamak rail gun limiter, 9:4229 (BA;GB)
**Lower Hybrid Heating**
Parametric excitation of ion-sound quasimodes during lower-hybrid heating experiments in tokamaks, 9:4104 (J;US)
**Magnet Coils**
Near-term tokamak reactor designs with high performance resistive magnets, 9:4201 (BA;XA)
**Mechanical Structures**
To the calculation of stress-strained state of the discharge chambers of tokamak devices, 9:4183 (R;SU;In Russian)
**Plasma**
Possible method for burn control by compression-decompression, 9:4063 (R;JP)
**Plasma Density**
Intense relativistic electron beam injector system for tokamak current drive, 9:4198 (J;US)
**Plasma Diagnostics**
Wills Plasma Physics Department annual progress report 1982, 9:4056 (R;AU)
**Plasma Drift**
Reduced magnetohydrodynamics and the Hasegawa—Mima equation, 9:4091 (J;US)
**Plasma Heating**
Linear and quasilinear theory of second electron cyclotron harmonic heating of tokamak plasmas, 9:4082 (J;US)
**Plasma Macroinstabilities**
Reduced equations for internal kinks in tokamaks, 9:4114 (J;US)
**Plasma Microinstabilities**
Drift-wave turbulence with wave—wave and wave—particle nonlinear effects in a sheared slab, 9:4090 (J;US)
**Plasma Waves**
Wills Plasma Physics Department annual progress report 1982, 9:4056 (R;AU)
**Poloidal Divertors**
Survey of fusion reactor technology. Development of design technology for the magnet system of Tokamak fusion reactor, 9:4176 (R;KR;In Korean)
**Runaway Electrons**
Wills Plasma Physics Department annual progress report 1982, 9:4056 (R;AU)
**Shock Waves**
Wills Plasma Physics Department annual progress report 1982, 9:4056 (R;AU)
**Stress Analysis**
Calculation of the mechanical strength of the T-15 tokamak discharge chamber, 9:4182 (R;SU;In Russian)
**Superconducting Magnets**
Normal phase detection in the "Tokamak-15" toroidal coil, 9:4179 (R;SU;In Russian)
**Tearing Instability**
Tokamak disruptions, 9:4037 (R;GB)

**TOKAMAK ETF**
**Tearing Instability**
Thermal consequences of plasma disruptions in TFTR and ETF, 9:4140 (BA;GB)

Optogalvanic response to light: photon energy vs photon number; comments, 9:3594 (J;US)
**Photon-Atom Collisions**
Optogalvanic response to light: photon energy vs photon number; comments, 9:3594 (J;US)
**Recovery**
Ion exchange and adsorption in nuclear chemical engineering, 9:2886 (R;US)
Protocol between the National Laboratory of Industrial Engineering and Technology of Portugal and the Junta de Energia Nuclear of Spain on supply and transfer of technology on uranium extraction from phosphoric acid, 9:1913 (R;PT;In Portuguese)
**Separation Processes**
Chemistry research and development. Annual progress report, October 1, 1981-September 30, 1982, 9:1930 (R;US)
**Supply and Demand**
Kinetics of resource utilization in large energy supply systems. Uranium resources and fuel cycles, 9:1905 (RA;CA)
**Welding**
Welding of uranium and uranium alloys, 9:2707 (R;US)
**X-Ray Fluorescence Analysis**
Determination, by x-ray-fluorescence spectrometry, of gold and uranium on resin, 9:2892 (R;ZA)

**URANIUM 233**
**Criticality**
American National Standard: use of borosilicate-glass raschig rings as a neutron absorber in solutions of fissle material, 9:3075 (B;US)
**Processing**
Miscellaneous programs, 9:1929 (RA;US)

**URANIUM 234**
**Activation Analysis**
Preparation and certification of a uranium reference material, 9:2894 (R;ZA)
**Excretion**
Levels of $^{234}U$, $^{238}U$ and $^{230}Th$ in excreta of uranium mill crushermen, 9:3391 (J;GB)
**X-Ray Fluorescence Analysis**
Preparation and certification of a uranium reference material, 9:2894 (R;ZA)

**URANIUM 235**
**Criticality**
American National Standard: use of borosilicate-glass raschig rings as a neutron absorber in solutions of fissle material, 9:3075 (B;US)
**Laser Isotope Separation**
Apparatus for enrichment of uranium by double photoionization (Patent application), 9:1916 (TG;US)
Process for separation of isotopes from a gaseous mixture (Patent application), 9:1920 (TG;US)
**Radioecological Concentration**
Importance of biota in radionuclide transport at the SL-1 radioactive waste disposal area, 9:3292 (RA;US)

**URANIUM 235 TARGET**
**Neutron Reactions**
Delayed neutron precursors at masses 97—99 and 146—148, 9:3910 (J;US)

**URANIUM 238**
**Activation Analysis**
Preparation and certification of a uranium reference material, 9:2894 (R;ZA)
**Excretion**
Levels of $^{234}U$, $^{238}U$ and $^{230}Th$ in excreta of uranium mill crushermen, 9:3391 (J;GB)
**Laser Isotope Separation**
Apparatus for enrichment of uranium by double photoionization (Patent application), 9:1916 (TG;US)
Process for separation of isotopes from a gaseous mixture (Patent application), 9:1920 (TG;US)
**Multipole Transitions**
Nonradiative excitation of the muonic atom $^{238}U$ as an inverse conversion process, 9:3930 (R;SU)
**Muonic Atoms**
Nonradiative excitation of the muonic atom $^{238}U$ as an inverse conversion process, 9:3930 (R;SU)
**X-Ray Fluorescence Analysis**
Preparation and certification of a uranium reference material, 9:2894 (R;ZA)

**URANIUM 238 TARGET**
**Iron 56 Reactions**
Charge and mass exchange in $^{56}Fe$-induced reactions at 8.3 MeV/nucleon, 9:3891 (J;US)
**Oxygen 16 Reactions**
Quark matter formation in high energy nucleus-nucleus collisions - predictions and observations, 9:3929 (RA;XC)
**Proton Reactions**
Identification of $^{233}Ac$, 9:3935 (J;US)

**URANIUM ALLOYS**

Design
A program of hands-on training in the operation of a critical assembly facility, 9:2391 (J;US)
Educational Facilities
A program of hands-on training in the operation of a critical assembly facility, 9:2391 (J;US)
Experience with hands-on training at the Los Alamos critical assemblies facility, 9:2392 (J;US)
Gamma Dosimetry
Neutron and gamma-ray measurements on the LANL Little Boy Comet Assembly, 9:2390 (R;US)
Neutron Dosimetry
Neutron and gamma-ray measurements on the LANL Little Boy Comet Assembly, 9:2390 (R;US)
Training
Experience with hands-on training at the Los Alamos critical assemblies facility, 9:2392 (J;US)
ZINC
Biological Accumulation
Heavy metal and sulphur concentrations in Sphagnum magellanicum Brid. in the Maritime Provinces, Canada, 9:3415 (J;NL)
Zinc and cadmium in lettuce and radish grown in soils collected near electrical transmission (hydro) towers, 9:3416 (J;NL)
Charged-Particle Transport
Distributions of accelerated ion ranges. Helium and lithium isotopes, 9:3961 (R;SU;In Russian)
Ecological Concentration
Heavy metal and arsenic concentrations of a woodland moss Hylocomium splendens (Hedw.) Br. et Sch. growing around a coal-fired power plant in coastal southern Finland, 9:3409 (R;SE)
Trace element concentrations in different trophic levels near the site of a future coal-fired power plant and related facilities, 9:3282 (RA;US)
Physical Radiation Effects
Investigation of lattice defects in zinc after proton and electron irradiation, 9:2699 (R;DE;In German)
Surface Energy
Surface energy of zinc, 9:2723 (J;US)
Uptake
Zinc and cadmium in lettuce and radish grown in soils collected near electrical transmission (hydro) towers, 9:3416 (J;NL)
ZINC 64 TARGET
Alpha Reactions
Level structure of $^{67}$Ge and its implications for the general structure of nuclei in the 1f-2p shell, 9:3890 (J;US)
ZINC 65
Tissue Distribution
Biological elimination rates of radioisotopes by mallards contaminated at a liquid radioactive waste disposal area, 9:3393 (J;GB)
ZINC 70 TARGET
Carbon 14 Reactions
Complementary investigation of neutron-rich exotic nuclei in the region of Fe, Ni and Zn, 9:3893 (R;FR)
ZINC ALLOYS
Ferromagnetism
Hydrogen effect on the itinerant ferromagnets TiBe/sub 2-x/Cu/sub x/ and ZrZn/sub 1.9/, 9:2758 (J;GB)
ZINC CHLORIDES
Catalytic Effects
Systematic chemical-catalytic study of coal structure under subsoftening conditions, 9:1780 (D;US)
ZINC COMPLEXES
Physico-chemical investigation of some areas of fundamental significance to biophysics. Annual report, 1982-1983, 9:3001 (R;US)
ZINC FLUORIDES
Crystal-Phase Transformations
Random fields and three-dimensional Ising models: Co/sub x/Zn/sub 1-x/F$_2$, 9:2854 (J;US)
Ising Model
Random fields and three-dimensional Ising models: Co/sub x/Zn/sub 1-x/F$_2$, 9:2854 (J;US)
Neutron Diffraction
Random fields and three-dimensional Ising models: Co/sub x/Zn/sub 1-x/F$_2$, 9:2854 (J;US)
ZINC IONS
Energy Levels
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)
Oscillator Strengths
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)
ZINC OXIDES
Annealing
Rutherford backscattering evidence for solid phase laser annealing of Corning 7059 glass and ZnO thin films, 9:2866 (J;US)
Catalytic Effects
Catalytic decomposition of gaseous $SO_3$, 9:2927 (J;US)
Sorptive Properties
Investigation of adsorption and catalytic decomposition of the systems ethanol on ZnO and $H_2/H_2O$ on ZnO/GaAs, 9:2911 (R;DE;In German)
ZINC PHOSPHIDES
Deposition
Deposition and properties of zinc phosphide films, 9:2865 (J;US)
Electric Conductivity
Deposition and properties of zinc phosphide films, 9:2865 (J;US)
ZINC SELENIDES
Impurities
Extended x-ray absorption fine structure studies of diffused copper impurities in ZnSe, 9:2838 (J;US)
ZINC SULFATES
Response Modifying Factors
Study of radio-restoration by various mineral salts and silica rich products (Tuf and Pouzzolane) of rice embryos (Oryza-sativa L, Cigalon variety) exposed to cobalt 60 gamma rays, 9:3387 (R;FR;In French)
ZINC TELLURIDES
Optical Dispersion
Dispersion of the refractive index of InP and ZnTe, 9:2864 (J;US)
Refractivity
Dispersion of the refractive index of InP and ZnTe, 9:2864 (J;US)
ZIRCALOY
*For unspecified Zircaloy alloys.*
*See also ZIRCALOY 4*
Creep
Effects of temperature and pressure on the in-reactor creepdown of Zircaloy fuel cladding, 9:2745 (J;US)
ZIRCALOY 4
Oxidation
Layer structures of oxide scales on zircaloy-4 tube exposed to steam-hydrogen mixture at high temperatures, 9:2333 (R;JP;In Japanese)
ZIRCONIUM
Binding Energy
Core photoelectron shifts in reduced zirconium halides. Relaxation effects and delocalized metal-metal bonding, 9:2929 (J;US)
Photoionization
Optogalvanic response to light: photon energy vs photon number; comments, 9:3594 (J;US)
Photon-Atom Collisions
Optogalvanic response to light: photon energy vs photon number; comments, 9:3594 (J;US)

**Physical Radiation Effects**
Defect production rates in ion-irradiated metals, 9:4174 (RA;JP;In Japanese)
Trapping-detrapping phenomena of hydrogen, helium and their isotopes into or from materials, 9:4166 (RA;JP;In Japanese)
**Proton Reactions**
Estimation of neutron-induced spallation yields of krypton isotopes, 9:3896 (J;US)
**Spectral Shift**
Core photoelectron shifts in reduced zirconium halides. Relaxation effects and delocalized metal-metal bonding, 9:2929 (J;US)

**ZIRCONIUM 101**
**Rotational States**
Rotational structure and Nilsson orbitals for highly deformed odd-A nuclei in the A~100 region, 9:3912 (J;US)

**ZIRCONIUM 90**
**Nuclear Structure**
Gamow-Teller strength function for $^{90}$Zr: Effects of spin and isospin exchange forces, and ground-state correlations, 9:3913 (J;US)

**ZIRCONIUM 90 TARGET**
**Pion Minus Reactions**
Dependence of the excitation energy, width, and cross section of the isovector monopole resonance, 9:3908 (R;US)
**Pion Plus Reactions**
Isobaric analog states in pion single-charge-exchange reactions on and above the (3,3) resonance energy, 9:3875 (J;US)

**ZIRCONIUM 95**
**Uptake**
Uptake of γ-emitting radionuclides by soils placed in test reactor leaching ponds, 9:3330 (RA;US)

**ZIRCONIUM ALLOYS**
**Crystal Structure**
Deuterium site occupation in the oxygen-stabilized eta-carbides Zr3V3OD/sub x/. I. Preparation and neutron powder diffraction, 9:2709 (J;US)
Deuterium site occupation in the oxygen-stabilized eta-carbides Zr3V3OD/sub x/. II. Application of a geometric model, 9:2710 (J;US)
**Ferromagnetism**
Hydrogen effect on the itinerant ferromagnets TiBe/sub 2-x/ Cu/sub x/ and ZrZn/sub 1.9/, 9:2758 (J;GB)
**Inhibition**
Hydrogen effect on the itinerant ferromagnets TiBe/sub 2-x/ Cu/sub x/ and ZrZn/sub 1.9/, 9:2758 (J;GB)
**Physical Radiation Effects**
Dimensional changes in cold-worked Zr-2.5 wt% Nb pressure tubes in CANDU reactors, 9:2272 (J;US)
Preliminary small angle neutron scattering investigations of neutron irradiation produced voids, 9:2770 (BA;US)

**ZIRCONIUM BROMIDES**
**Binding Energy**
Core photoelectron shifts in reduced zirconium halides. Relaxation effects and delocalized metal-metal bonding, 9:2929 (J;US)
**Spectral Shift**
Core photoelectron shifts in reduced zirconium halides. Relaxation effects and delocalized metal-metal bonding, 9:2929 (J;US)

**ZIRCONIUM CHLORIDES**
**Binding Energy**
Core photoelectron shifts in reduced zirconium halides. Relaxation effects and delocalized metal-metal bonding, 9:2929 (J;US)
**Spectral Shift**
Core photoelectron shifts in reduced zirconium halides. Relaxation effects and delocalized metal-metal bonding, 9:2929 (J;US)

**ZIRCONIUM HYDRIDES**
**Binding Energy**
Core photoelectron shifts in reduced zirconium halides. Relaxation effects and delocalized metal-metal bonding, 9:2929 (J;US)
**Physical Radiation Effects**
Trapping-detrapping phenomena of hydrogen, helium and their isotopes into or from materials, 9:4166 (RA;JP;In Japanese)
**Spectral Shift**
Core photoelectron shifts in reduced zirconium halides. Relaxation effects and delocalized metal-metal bonding, 9:2929 (J;US)

**ZIRCONIUM IONS**
**Energy Levels**
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)
**Oscillator Strengths**
Oscillator strengths and wavelengths for the copper and zinc isoelectronic sequences; Z = 29 to 42, 9:3592 (J;US)
**S States**
Revised $3p^6 3d^8\ {}^1S_0$ level of Sr XIII, Y XIV, Zr XV, Nb XVI, and Mo XVII, 9:3560 (J;US)

**ZIRCONIUM OXIDES**
**Photoelectron Spectroscopy**
Contribution to the surface quantitative analysis by X-ray photo-electron spectroscopy (XPS), 9:2776 (RA;BR;In Spanish)
**Quantity Ratio**
Contribution to the surface quantitative analysis by X-ray photo-electron spectroscopy (XPS), 9:2776 (RA;BR;In Spanish)
**X-Ray Spectroscopy**
Contribution to the surface quantitative analysis by X-ray photo-electron spectroscopy (XPS), 9:2776 (RA;BR;In Spanish)

**ZOOPLANKTON**
**Radiation Monitoring**
Transuranium nuclides in pelagic and benthic components of test reactor leaching ponds, 9:3329 (RA;US)

## NOTICE

During the preparation of *ERA*, Volume 9, Number 2, an error was introduced that resulted in the abstract numbers on all entries in the Subject and Contract Number Indexes being six digits too low. The error arose when the initial abstract number 1751 was used instead of the correct number 1757.

I regret the inconvenience to the users of *ERA* and will eliminate the error from our file prior to preparation of the cumulative indexes.

David E. Bost

# REPORT NUMBER INDEX

The numbers assigned to reports cited in this publication appear in the first column of the index. Cross reference information and/or availability are included as appropriate. Abbreviations used in the availability column are elaborated at the end of the index. To expedite the filling of orders for reports from NTIS and TIC, an order number in the form, DE82000001 OR TI82000001, appears in column 3. Order numbers with DE prefixes may be used in ordering from both NTIS and TIC. Numbers with TI prefixes are valid at TIC only. Requesters are urged to use this order number where provided. In column 4, one or more DOE distribution categories are indicated, e.g. , STD-10, MN-25. STD indicates distribution was made in full-size copy; MN indicates microcopy distribution; ND indicates no distribution was made. These category numbers are included to assist DOE librarians in responding to requests for reports in their collections. The UC (Unclassified Distribution Categories) are defined in DOE/TIC-4500, available from TIC. The citation numbers are given in column 5. NOTE: DOE attempts to disseminate its information as broadly as possible. Even though a report may contain some degree of illegibility, it is believed that the report may still make a contribution. The presence of a 1, 2, or 3 following NTIS in the availability column denotes the extent to which a report may be illegible and the form in which it is available: 1 = 1 to 5% illegibility, available PC and MF; 2 = 6 to 10% illegibility, available MF only; 3 = 11% or more illegibility, available PC only. For the users of DOE/RECON, report ordering may be accomplished more expeditiously via the on-line system. Employees of DOE or DOE contractors are urged to order from the Technical Information Center (TIC); all others should order from the National Technical Information Service (NTIS). Procedures for on-line ordering are detailed in the DOE/RECON User's Manual (DOE/TIC-4586).

# ORDER NUMBER CORRELATION

This correlation list is provided for those organizations where document storage is alphanumeric by report number and request may be received by order number. For other information about a document (abstract number, distribution category, availability, and price), please refer to the Report Number Index.

## Abbreviations Used in Availability Column

**EM** Available in aperture card format only. Inquiries regarding the availability of these items should be addressed to USDOE-TIC, P.O. Box 62, Oak Ridge, Tennessee, 37831.

**ETEC** Available *only to requesters within the United States* from the Energy Technology Engineering Center, P.O. Box 1449, Canoga Park, California 91304.

**GJO** Available from DOE Grand Junction Office, P.O. Box 2567, Grand Junction, Colorado 81501.

**GPO** For sale by the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402.

**HMSO** Her Majesty's Stationery Office, Atlantic House, Holborn Viaduct, London, England, EC1P 1BN.

**NSO** Available *only to requesters within the United States* from the Nuclear Standards Office, Oak Ridge National Laboratory, P.O. Box X, Oak Ridge, Tennessee 37831.

**NTIS** For sale by the National Technical Information Service (NTIS), U.S. Department of Commerce, Springfield, Virginia 22161. Price given is the domestic price for paper copy; prices for foreign purchasers are in most instances twice the domestic price.

**TIC** Available from the Technical Information Center, P.O. Box 62, Oak Ridge, Tennessee 37831.

## NTIS NORTH AMERICAN PRICE CODES

Most NTIS products and services are now announced by price codes and, therefore, without specific prices in NTIS journals, newsletters and indexes.

The current dollar equivalent for each code is shown in the schedule below. Orders must list the accession number(s) and be accompanied by the total dollar amount from the current schedule.

**NORTH AMERICAN CONTINENT PRICE SCHEDULE**

**Customers in Canada, United States, and Mexico please use this price schedule; other addressees, write for Folder PR-360-4.**

| MICROFICHE | | | |
|---|---|---|---|
| A01 | $4.50 | E01 | $6.50 |
| PAPER COPY | | E02 | 7.50 |
| | | E03 | 9.50 |
| A02 | 7.00 | E04 | 11.50 |
| A03 | 8.50 | E05 | 13.50 |

# CODES USED ON INDEX LINES

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R:SU:In Russian). The language designator does not appear if the document is published in English.

## DOCUMENT TYPES

J Journal article
TJ Translation of a journal article
R Report
RA Report analytic
B Book
BA Book analytic
P Patent
E Engineering materials
D Thesis or dissertation
TG Translation (general)
TA Translation (analytic)

# AVAILABILITY OF REFERENCES ABSTRACTED

## REPORTS

Most reports abstracted in this publication may be obtained from

National Technical Information Service (NTIS)
5285 Port Royal Road
Springfield, VA 22161

or

DOE Technical Information Center (TIC)
P. O. Box 62
Oak Ridge, TN 37831
ATTN: Customer Services Division

**Note:** DOE offices and contractors should order from TIC; all others should order from NTIS. For more specific information on ordering, please note the introductory paragraph to the Report Number Index. For assistance in obtaining reports that do not have an Order No. (DE...) or other availability indicated in the citation or Report Number Index, contact TIC.

## PATENTS

Although not cataloged as reports, patents cited from each country are listed in the Report Number Index under PATENTS-AU, PATENTS-FR, PATENTS-US, etc. U. S. Patent Applications, e.g., A 293,415, are available from NTIS.

## NON-REPORT DOCUMENTS

Check the citation closely for the availability of such documents as journal articles, conference papers, books, and monographs. It may be necessary to request directly from the publisher or originator or to contact local, state, or university libraries or commercial reprint services.

Dissertations are available from University Microfilms International, Dissertation Copies, P. O. Box 1764, Ann Arbor, MI. Please request by Order No., e.g., DA82-11997.

## OTHER

When GPO is cited as available source, order from Superintendent of Documents, Government Printing Office, Washington, D. C. 20402.

# REPORT COLLECTIONS

The libraries listed below purchase and maintain microfiche collections of DOE and foreign reports. Most of these libraries have microfiche reader-printers or other photocopy facilities with which to reproduce enlarged copies from microfiche. Charges for reproduction services vary.

Vienna, Austria

**OECD NUCLEAR ENERGY AGENCY (NEA)**
British Library Lending Division
Boston Spa, Wetherby, Yorkshire, England

**DOE/RECON SYSTEM**

COMPUTER SEARCH SERVICE

DOE/RECON is an interactive on-line information retrieval system developed to provide rapid and easy access to energy-related data bases. The acronym RECON stands for REmote CONsole, which signifies that the system can be accessed by users located at various sites across the United States.

The system permits users to carry on a dialogue with the computer. This dialogue allows browsing through large data bases and can result in retrieval of citations which answer specific needs. Desired information can be selectively retrieved via simple yet powerful commands sent to the computer from the terminal keyboard.

Search logic may be formulated by the use of indexed terms, such as keywords, authors, categories, or corporate authors. As the search session progresses, AND, OR and NOT Boolean logic may be used to improve precision, i.e., the specificity of the retrieved set. For most data bases, the user may limit the scope of the search to particular years or volumes of data. Upon completion of a search, the user may choose to have the results displayed or printed at his/her terminal or to have the results printed and mailed the following day.

The DOE/RECON system is supported by dual IBM 370/3033 computers. Two IBM 3705 front-end communications computers are used to perform the message switching. Although most of the 40 data bases are bibliographic in content, DOE/RECON is not limited to this type; the Research in Progress (RIP) data base is one that is non-bibliographic. Presently, over 2 million references are available.

Requests for information concerning authorization to access the DOE/RECON system should be addressed to:
